DESCRIPTION

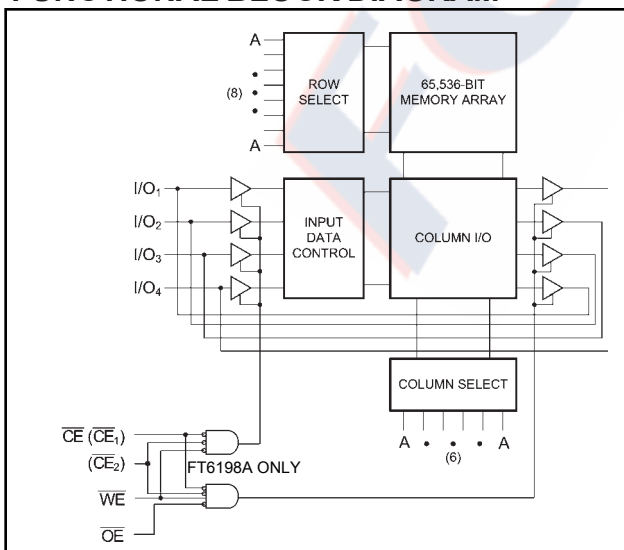

The FT6198/L and FT6198A/L are 65,536-bit ultra high-speed static RAMs organized as 16K x 4. Each device features an active low Output Enable control to eliminate data bus contention. The FT6198/L also have an active low Chip Enable (the FT6198A/L have two Chip Enables, both active low) for easy system expansion. The CMOS memories require no clocks or refreshing and have equal access and cycle times. Inputs are fully TTL-compatible. The RAMs operate from a single 5V ± 10% tolerance power supply. Data integrity is maintained with supply

voltages down to 2.0V. Current drain is typically 10 μ A from a 2.0V supply.

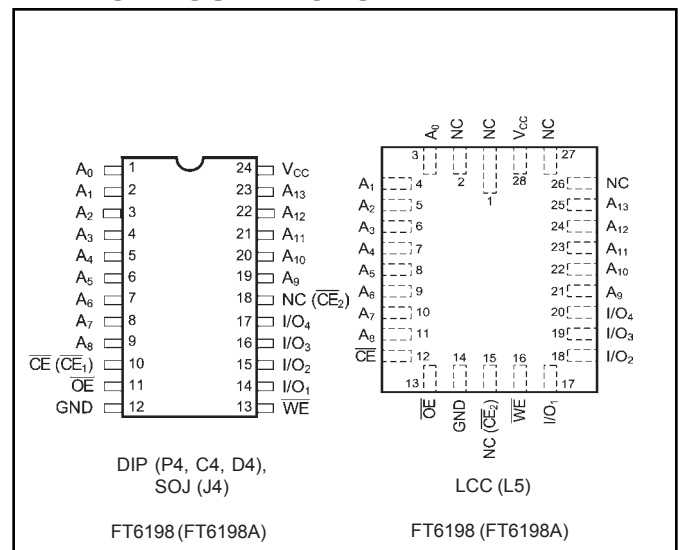

Access times as fast as 12 nanoseconds are available, permitting greatly enhanced system operating speeds. CMOS is used to reduce power consumption to a low 715 mW active, 193 mW standby.

The FT6198/L and FT6198A/L are available in 24-pin 300 mil DIP and SOJ, and 28-pin 350 x 550 mil LCC packages providing excellent board level densities.

Notes:

5. \overline{WE} is HIGH for READ cycle.

READ CYCLE NO. 2 (ADDRESS Controlled)^(5,6)

Notes:

6. \overline{CE} (\overline{CE}_1 , \overline{CE}_2 for FT6198A/L) and \overline{OE} are LOW READ cycle.
7. \overline{OE} is LOW for the cycle.
8. ADDRESS must be valid prior to, or coincident with \overline{CE} (\overline{CE}_1 and \overline{CE}_2 for FT6198A/L) transition LOW.

10. Read Cycle Time is measured from the last valid address to the first transitioning address.
11. Transitions caused by a chip enable control have similar delays irrespective of whether \overline{CE}_1 or \overline{CE}_2 causes them (FT6198A/L).
12. \overline{CE}_1 , \overline{CE}_2 for FT6198A/L.

Notes:

13. \overline{CE} (\overline{CE}_1 , \overline{CE}_2 for FT6198A/L) and \overline{WE} must be LOW for WRITE cycle.
14. \overline{OE} is LOW for this WRITE cycle.

15. If \overline{CE} (\overline{CE}_1 or \overline{CE}_2 for FT6198A/L) goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high impedance state.
16. Write Cycle Time is measured from the last valid address to the first transitioning address.

Note:

Because of the ultra-high speed of the FT6198/L and FT6198A/L, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the V_{CC} and ground planes directly up to the contactor fingers. A 0.01 μ F high

frequency capacitor is also required between V_{CC} and ground. To avoid signal reflections, proper termination must be used; for example, a 50 Ω test environment should be terminated into a 50 Ω load with 1.73V (Thevenin Voltage) at the comparator input, and a 116 Ω resistor must be used in series with D_{OUT} to match 166 Ω (Thevenin Resistance).
