

L4C381 T-49-11

# 16-bit cascadable arithmetic/logic unit

## general information

The L4C381 is designed as a flexible, high speed 16-bit Arithmetic and Logic Unit slice. It combines four 381 type 4-bit ALUs, a lookahead carry generator, and miscellaneous interface logic into a single 68-pin package. While containing many new features to support high speed pipelined architectures and single 16-bit bus architectures, it retains full functional and performance compatibility with the bipolar 381 designs.

## L4C381 architecture

The L4C381 operates on the 16-bit operands denoted A and B, and produces a single 16-bit result F. Three select lines control the ALU and provide 3 arithmetic, 3 logical, and 2 initialization functions. Full ALU status is provided, allowing the L4C381 to be cascaded to form longer word lengths. Registers are provided on both the ALU inputs and the output, but these may be bypassed under user control. An internal feedback path allows the registered ALU output to be routed to one of the ALU inputs accommodating chain operations and accumulation. Furthermore, the A or B input to the ALU can be forced to zero allowing unary functions to be performed on either operand.

### ALU operation

Select lines  $S_{0-2}$  determine the operation to be performed. The ALU functions and their corresponding select codes are shown in figure 1.

$S_2$	$S_1$	$S_0$	FUNCTION
0	0	0	CLEAR (F = 00 ... 0)
0	0	1	NOT(A) + B
0	1	0	A + NOT(B)
0	1	1	A + B
1	0	0	A XOR B
1	0	1	A OR B
1	1	0	A AND B
1	1	1	PRESET (F = 11 ... 1)

Figure 1. ALU Function Definition

The functions B minus A and A minus B can be achieved by setting the carry input  $C_0$  of the least significant slice and selecting codes 001 and 010 respectively.

### ALU status

The ALU provides Overflow and Zero status bits. Also, Carry, Propagate, and Generate outputs are provided for cascading. These outputs are defined for the three arithmetic functions only. The ALU sets the Zero output when all sixteen output bits are zero. The Generate, Propagate,  $C_{16}$ , and OVF flags for the A + B operation are defined in figure 2. The status flags produced for NOT(A) + B and A + NOT(B) can be found by complementing  $A_i$  and  $B_i$  in figure 2 respectively.

### operand registers

The L4C381 has two 16-bit wide input registers for operands A and B. These registers are rising edge triggered by a common clock. Each register is independently enabled by control signals ENA and ENB.

## absolute maximum ratings

Supply Voltage	-0.5 to 7.0V
Input Voltage	0 to 5.5V
Output Voltage	0 to 5.5V
Operating Temperature (Ambient)	-55°C to 125°C
Storage Temperature	-65°C to 150°C

## recommended operating conditions

PARAMETER	min	typ	max	unit
$V_{CC}$ Supply Voltage Commercial	4.75	5.0	5.25	V
$V_{CC}$ Supply Voltage Military	4.50	5.0	5.5	V
$I_{OL}$ Low Level Output Current			8.0	mA
$I_{OH}$ High Level Output Current			-2.0	mA
$T_{AMB}$ Operating Temperature (Commercial)	0	25	70	°C
$T_{AMB}$ Operating Temperature (Military)	-55	25	125	°C

## features

- High-speed, 16-bit ALU
- Input and output registers can be made transparent
- Easily cascadable with or without carry lookahead
- Extension to 54S381 instruction set
- Force A or B → 0 allows two's complement, PASSA, PASSB instructions
- Internal feedback path for accumulation
- Low-power, high-speed CMOS technology
- All status and carry outputs available

## pin definitions

A <sub>0-15</sub>	A Input
B <sub>0-15</sub>	B Input
F <sub>0-15</sub>	Result Output
C <sub>0</sub>	Carry Input
C <sub>16</sub>	Carry Output
P	Carry Propagate Output
G	Carry Generate Output
OVF	ALU Overflow Flag
ZERO	ALU Result Zero Flag
ENA	A Register Enable
ENB	B Register Enable
FT <sub>AB</sub>	A, B, Register Feedthrough Control
ENF	F Register Enable
FT <sub>F</sub>	F Register Feedthrough Control
OS <sub>B</sub>	B Operand Select
OS <sub>A</sub>	A Operand Select
I <sub>0-2</sub>	Instruction Select
OE	Output Enable
CLK	Clock
V <sub>CC</sub> , GND	Power Supply

## electrical characteristics

PARAMETER	TEST CONDITIONS	min	typ	max	unit
V <sub>IL</sub>	Low Level Input Voltage			0.8	V
V <sub>IH</sub>	High Level Input Voltage		2.0		V
V <sub>OL</sub>	Low Level Output Voltage	I <sub>OL</sub> = 8mA		0.5	V
V <sub>OH</sub>	High Level Output Voltage	I <sub>OH</sub> = -2.0mA	3.5		V
I <sub>IL</sub>	Low Level Input Current	V <sub>IL</sub> = 0.4V		20	μA
I <sub>IH</sub>	High Level Input Current	V <sub>IH</sub> = 2.4V		20	μA
I <sub>CC</sub>	Supply Current (Quiescent)			0.5	mA
I <sub>CC</sub>	Supply Current (Dynamic)		15 <sup>1</sup>	25 <sup>2</sup>	mA

1) Typical I<sub>CC</sub> conditions: 5MHz clock rate, V<sub>IH</sub> = 2.4V, V<sub>IL</sub> = 0.4V, V<sub>CC</sub> = 5V, T<sub>A</sub> = 25°C, random input patterns.  
 2) Maximum I<sub>CC</sub> conditions: 5MHz clock rate, V<sub>IH</sub> = 2.0V; V<sub>IL</sub> = 0.8V; V<sub>CC</sub> = 5.5V; T<sub>A</sub> = -55°C, all outputs toggling every cycle.

This architecture allows the L4C381 to accept arguments from a single 16-bit data bus. For those applications which do not require registered inputs, both the A and B operand registers can be made transparent with the FT<sub>AB</sub> control line. When the FT<sub>AB</sub> control is asserted, the A and B input registers are bypassed, however, they continue to function normally via the EN<sub>A</sub> and EN<sub>B</sub> controls. The contents of the input registers will again be available to the ALU if the FT<sub>AB</sub> control is released.

### output register

The output of the ALU drives the input of a 16-bit register. This rising-edge-triggered register is clocked by the same clock as the input registers. The output register is enabled by the EN<sub>F</sub> control signal. By disabling the output register, intermediate results can be held while loading new input operands. Three-state drivers controlled by the OE input allow the L4C381 to be configured in a single bidirectional bus system. The output register can be made transparent by asserting the FT<sub>F</sub> control signal. When the FT<sub>F</sub> control is asserted, the output register is bypassed, however, it continues to function normally via the EN<sub>F</sub> control. The contents of the output register will again be available on the output pins if FT<sub>F</sub> is released. With both FT<sub>AB</sub> and FT<sub>F</sub> true (high) the L4C381 is functionally identical to four cascaded 54S381-type devices.

### operand selection

The two operand select lines OS<sub>A</sub> and OS<sub>B</sub> control multiplexers immediately preceding the ALU inputs. These multiplexers provide an operand force-to-zero function as well as result feedback to the B input. Figure 3 shows the inputs to the ALU as a function of the operand select inputs. Either the A or B operands may be forced to zero.

OS <sub>B</sub>	OS <sub>A</sub>	OPERAND B	OPERAND A
0	0	F	A
0	1	0	A
1	0	B	0
1	1	B	A

Figure 3. Operand Selection Control

When both operand select lines are false (low), the L4C381 is configured as a chain calculation ALU. The registered ALU output is passed back to the B input to the ALU. This allows accumulation operations to be performed by providing new operands via the A input port. The accumulator can be preloaded from the A input by setting OS<sub>A</sub> true. By forcing the function select lines to the CLEAR state (000), the accumulator may be cleared. Note that this feedback operation is not affected by the state of the FT<sub>F</sub> control. That is, the F outputs of the L4C381 may be driven directly by the ALU (FT<sub>F</sub> = true). The output register continues to function, however, and provides the ALU B operand source.
