CY7C102A

## 256K x 4 Static RAM with Separate I/O

### Features

- High speed
  - $t_{AA} = 12$  ns
- Transparent write (7C101A)
- CMOS for optimum speed/power
- Low active power
  - 910 mW
- Low standby power
  - 275 mW
- 2.0V data retention (optional)
  - 100  $\mu$ W
- Automatic power-down when deselected
- TTL-compatible inputs and outputs

### Functional Description

The CY7C101A and CY7C102A are high-performance CMOS static RAMs organized as 262,144 x 4 bits with separate I/O. Easy memory expansion is provided by active LOW chip enable ( $\overline{CE}$ ) and three-state drivers. Both devices have an automatic power-down feature, reducing the power consumption by more than 65% when deselected.

Writing to the device is accomplished by taking both chip enable ( $\overline{CE}$ ) and write enable ( $\overline{WE}$ ) inputs LOW. Data on the four input pins ( $I_0$  through  $I_3$ ) is written into the memory location specified on the address pins ( $A_0$  through  $A_{17}$ ).

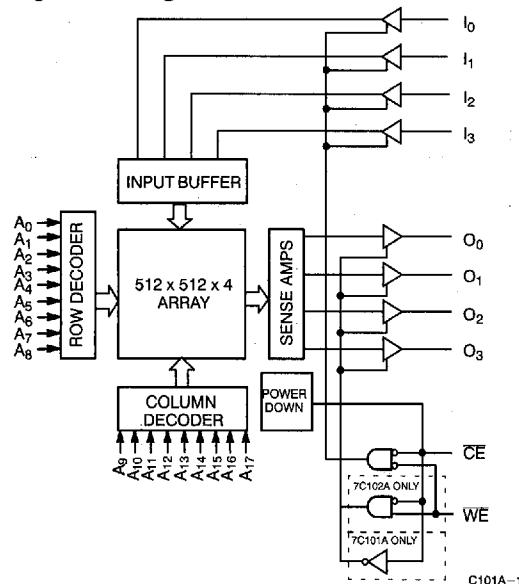

Reading the device is accomplished by taking chip enable ( $\overline{CE}$ ) LOW while write en-

able ( $\overline{WE}$ ) remains HIGH. Under these conditions, the contents of the memory location specified on the address pins will appear on the four data output pins ( $O_0$  through  $O_3$ ).

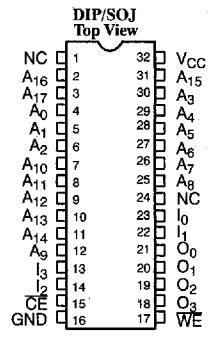

The data output pins on the CY7C101A and the CY7C102A are placed in a high-impedance state when the device is deselected ( $\overline{CE}$  HIGH). The CY7C102A's outputs are also placed in a high-impedance state during a write operation ( $\overline{CE}$  and  $\overline{WE}$  LOW). In a write operation on the CY7C101A, the output pins will carry the same data as the inputs after a specified delay.

The CY7C101A and CY7C102A are available in standard 400-mil-wide DIPs and SOJs.

**Notes:**

6. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I<sub>OL</sub>/I<sub>OH</sub> and 30-pF load capacitance.
7. At any given temperature and voltage condition, t<sub>HZCE</sub> is less than t<sub>LZCE</sub> and t<sub>HZWE</sub> is less than t<sub>LZWE</sub> for any given device.
8. t<sub>HZCE</sub>, and t<sub>HZWE</sub> are specified with a load capacitance of 5 pF as in part (b) of AC Test Loads. Transition is measured  $\pm 500$  mV from steady-state voltage.
9. The internal write time of the memory is defined by the overlap of CE and WE LOW. CE and WE must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.
