 DIVIDE-BY-SIXTEEN COUNTER

CONNECTION DIAGRAM
 PINOUT A

DESCRIPTION — The '93 is a 4-stage ripple counter containing a high speed flip-flop acting as a divide-by-two and three flip-flops connected as a divide-by-eight. HIGH signals on the Master Reset (MR) inputs override the clocks and force all outputs to the LOW state.

ORDERING CODE: See Section 9

FUNCTIONAL DESCRIPTION — The '93 is a 4-bit ripple type binary counter. It consists of four master/slave flip-flops which are internally connected to provide a divide-by-two section and a divide-by-eight section. Each section has a separate clock input which initiates state changes of the counter on the HIGH-to-LOW clock transition. State changes of the Q outputs do not occur simultaneously because of internal ripple delays. Therefore, decoded output signals are subject to decoding spikes and should not be used for clocks or strobes. The Q₀ output of each device is designed and specified to drive the rated fan-out plus the \overline{CP}_1 input of the device. A gated AND asynchronous Master Reset (MR₁, MR₂) is provided which overrides the clocks and resets (clears) all the flip-flops. Since the output from the divide-by-two section is not internally connected to the succeeding stages, the devices may be operated in various counting modes.

A. 4-Bit Ripple Counter — The output Q₀ must be externally connected to input \overline{CP}_1 . The input count pulses are applied to input \overline{CP}_0 . Simultaneous divisions of 2, 4, 8, and 16 are performed at the Q₀, Q₁, Q₂, and Q₃ outputs as shown in the Truth Table.

B. 3-Bit Ripple Counter — The input count pulses are applied to input \overline{CP}_1 . Simultaneous frequency divisions of 2, 4, and 8 are available at the Q₁, Q₂, and Q₃ outputs. Independent use of the first flip-flop is available if the reset function coincides with reset of the 3-bit ripple-through counter.
