

GD54/74HC258, GD54/74HCT258 QUAD 2-INPUT SELECTORS/MUXES WITH 3-STATE OUTPUTS

General Description

These devices are identical in pinout to the 54/74LS258. They consist of four 2-input multiplexers with common select and enable inputs, and inverted outputs. When the enable input is low, the four outputs assume the value as selected from the inputs. When the enable input is high, the outputs become high impedance state regardless of any other input values. Select decoding is done internally resulting in a single select input only. The HC/HCT 258 are similar in function to the HC/HCT 157 & 158 which do not have 3 state outputs, and to the HC/HCT 257 which have noninverted outputs. These devices are characterized for operation over wide temperature ranges to meet industry and military specifications.
