

GENERAL DESCRIPTION

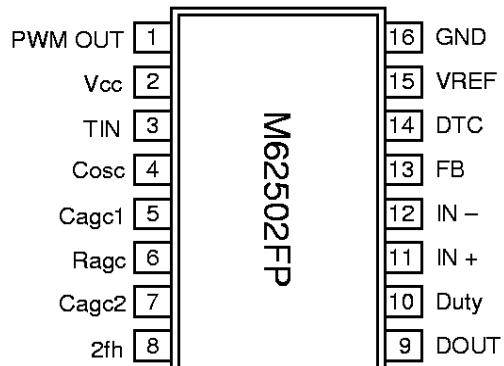

The M62502 is a controller for a deflection system of CRT display monitors. It performs a stable PWM control over a wide fluctuation of external signals, thanks to the built-in trigger mode oscillator. The IC is suitable for an application to a high voltage drive and a horizontal output correction of CRT monitors because of its following circuits and functions;

- Under Voltage Lock Out circuit (UVLO)
- Soft-start function

FEATURES

- PWM output synchronized with external signals
- Wide PWM control frequency
15kHz to 150kHz
- Soft start function
- Low voltage malfunction protection circuit
 - start Vcc > 9V
 - stop Vcc < 6V

M62502 application

- C1,C2 ----- These capacitors are for stabilization of Vcc and VREF.
- VR1 ----- It is decided considering a current capability of VREF. (The capability is about 5mA.) Recommended value is around 10kΩ.
- C3,D1 ----- They are for a soft start function. A time constant is decided considering VR1.
- Cagc1,2 ----- These capacitors are for stabilization of AGC circuit. A larger capacitor improves a stability of the system, however a system response is degraded. Recommended capacitor value is around 1μF.
- Cosc ----- This capacitor is for the saw-wave generation. Recommended capacitor value is around 1000pF.
- R1,R2,R3,R4 ----- They are for the gain setting of the error Amp. R2 should be several kΩ to dozens of kΩ to set a voltage gain 20dB to 40dB at f = 1kHz, so that the feed back loop is stable. When the voltage gain is too low, it causes jitter. Recommended values of C4, C5 and R1 are ; C4 = dozens of pF to several hundreds pF, C5 = several thousands pF to tens of thousands pF, R1 = dozens of kΩ to several hundreds kΩ.
- Ragc ----- This resistor is for the AGC setting of DOUT. Recommended value is 27kΩ.
- R5 ----- It is a pull-up resister of DOUT output, because DOUT is configured by the open collector circuit. Recommended value is several kΩ.
