DESCRIPTION:

The GTLP16612 is an 18-bit universal bus transceiver. It provides signal level translation, from TTL to GTLP, for applications requiring a high-speed interface between cards operating at TTL logic levels and backplanes operating at GTLP logic levels. GTLP provides reduced output swing (<1V), reduced input threshold levels, and output edge-rate control to minimize signal setting times. The GTLP16612 is a derivative of the Gunning Transceiver Logic (GTL) JEDEC standard JESD8-3 and incorporates internal edge-rate control, which is process, voltage, and temperature (PVT) compensated.

GTLP output low voltage is less than 0.5V. The output high is 1.5V, and the receiver threshold is 1V.

FUNCTIONAL DESCRIPTION:

The GTLP16612 combines a universal transceiver function with a TTL to GTLP translation. The A-Port and control pins operate at LVTTL or 5V TTL levels while the B-Port operates at GTLP levels. The transceiver logic includes D-type latches and D-type flip-flops to allow data flow in transparent, latched, and clock mode.
