- Available in SSOP, QSOP, and TSSOP packages

### APPLICATIONS:

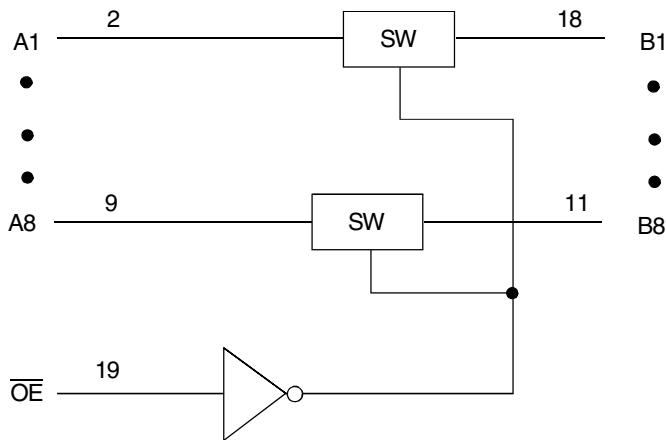

- 3.3V High Speed Bus Switching and Bus Isolation

### DESCRIPTION:

The octal bus switch has standard 245 pinouts. The CBTLV3245 is designed for asynchronous communication between data buses. When Output Enable ( $\overline{OE}$ ) is low, the 8-bit bus switch is on and port A is connected to Port B. When  $\overline{OE}$  is high, the switch is off and a high impedance exists between Port A and Port B.

To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor.

### NOTE:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### NOTES:

- Typical values are at  $V_{CC} = 3.3V, +25^{\circ}\text{C}$  ambient.
- The increase in supply current is attributable to each current that is at the specified voltage level rather than  $V_{CC}$  or GND.
- This is measured by the voltage drop between the A and B terminals at the indicated current through the switch.

## SWITCHING CHARACTERISTICS

Symbol	Parameter	$V_{CC} = 2.5V \pm 0.2V$		$V_{CC} = 3.3V \pm 0.3V$		Unit

$t_{DIS}$	Output Disable Time $\overline{OE}$ to A or B	1	5	1	5	ns

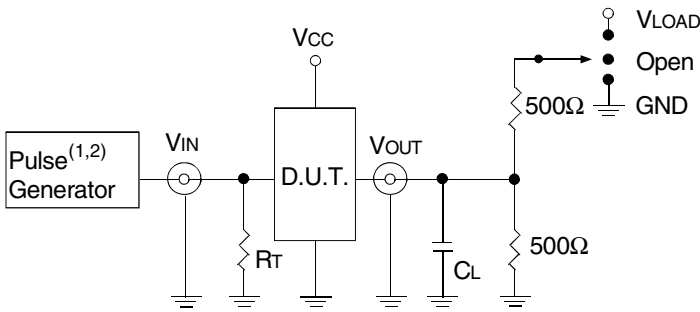

### NOTE:

- The propagation delay is the calculated RC time constant of the typical on-state resistance of the switch and the specified load capacitance driven by an ideal voltage source (zero output impedance).
