

OUTLINE

The R1221N Series are CMOS-based PWM step-down DC/DC Converter controllers embedded with a voltage detector, with low supply current.

Each step-down DC/DC converter in these ICs consists of an oscillator, a PWM control circuit, a reference voltage unit, an error amplifier, a soft-start circuit, a protection circuit, a PWM/VFM alternative circuit, a chip enable circuit, and resistors for voltage detection. A low ripple, high efficiency step-down DC/DC converter can be composed of this IC with only four external components, or a power-transistor, an inductor, a diode and a capacitor.

The output voltage of DC/DC converter can be supervised by the built-in voltage detector.

With a PWM/VFM alternative circuit, when the load current is small, the operation turns into the VFM oscillator from PWM oscillator automatically, therefore the efficiency at small load current is improved.

And the PWM/VFM alternative circuit is an option, in terms of C version and D version, the circuit is not included.

If the term of maximum duty cycle keeps on a certain time, the embedded protection circuit works. There are two types of protection function. One is latch-type protection circuit, and it works to latch an external Power MOS FET with keeping it disable. To release the condition of protection, after disable this IC with a chip enable circuit, enable it again, or restart this IC with power-on. The other is Reset-type protection circuit, and it works to restart the operation with soft-start and repeat this operation until maximum duty cycle condition is released. Either of these protection circuits can be designated by users' request.

FEATURES

- Wide Range of Input Voltage..... 2.3V to 13.2V
- Built-in Soft-start Function and two choices of Protection Function (Latch-type or Reset-type)
- Two choices of Oscillator Frequency..... 300kHz, 500kHz
- High Efficiency Typ. 90%
- Standby Current Typ. 0 μ A
- Setting Output Voltage Stepwise setting with a step of 0.1V in the range of 1.5V to 5.0V
- High Accuracy Output Voltage..... $\pm 2.0\%$
- Setting Detector Threshold Voltage..... Stepwise setting with a step of 0.1V in the range of 1.2V to 4.5V
- High Accuracy Detector Threshold Voltage $\pm 2.0\%$
- Low Temperature-Drift Coefficient of Output Voltage.... Typ. $\pm 100\text{ppm}/^\circ\text{C}$

APPLICATIONS

- Power source for hand-held communication equipment, cameras, video instruments such as VCRs, camcorders.
- Power source for battery-powered equipment.
- Power source for household electrical appliances.

BLOCK DIAGRAM

SELECTION GUIDE

In the R1221N Series, the output voltage, the detector threshold, the oscillator frequency, the optional function, and the tapping type for the ICs can be selected at the user's request.

The selection can be made by designating the part number as shown below;

R1221N $\underline{\text{xxxx}}$ -TR
 ↑↑↑
 abc

Code	Contents
a	Setting Output Voltage (V _{OUT}): Stepwise setting with a step of 0.1V in the range of 1.5V to 5.0V is possible.
b	Setting Detector Threshold (-V _{DET}) Stepwise setting with a step of 0.1V in the range of 1.2V to 4.5V is possible. A : 3.0V
c	Designation of Oscillator Frequency and Optional Function A : 300kHz, with a PWM/VFM alternative circuit, Latch-type protection B : 500kHz, with a PWM/VFM alternative circuit, Latch-type protection C : 300kHz, without a PWM/VFM alternative circuit, Latch-type protection D : 500kHz, without a PWM/VFM alternative circuit, Latch-type protection E : 300kHz, with a PWM/VFM alternative circuit, Reset-type protection F : 500kHz, with a PWM/VFM alternative circuit, Reset-type protection G : 300kHz, without a PWM/VFM alternative circuit, Reset-type protection H : 500kHz, without a PWM/VFM alternative circuit, Reset-type protection

PIN CONFIGURATION

PIN DESCRIPTION

TEST CIRCUITS

Inductor L : 27µH (Sumida Electronic, CD104) Diode SD : RB491D (Rohm, Schottky type)
 Capacitor CL: 47µF (Tantalum type) CIN: 22µF (Tantalum type)
 Power MOS PMOS : HAT1020R (Hitachi) Resistor R : 100kΩ

TYPICAL APPLICATIONS AND APPLICATION HINTS

PMOS: HAT1020R (Hitachi), Si3443DV (Siliconix) L : CD105 (Sumida, 27 μ H)
 SD1 : RB491D (Rohm) C_{OUT} : 47 μ F (Tantalum Type)
 C_{IN} : 10 μ F (Tantalum Type) R1 : 100k Ω

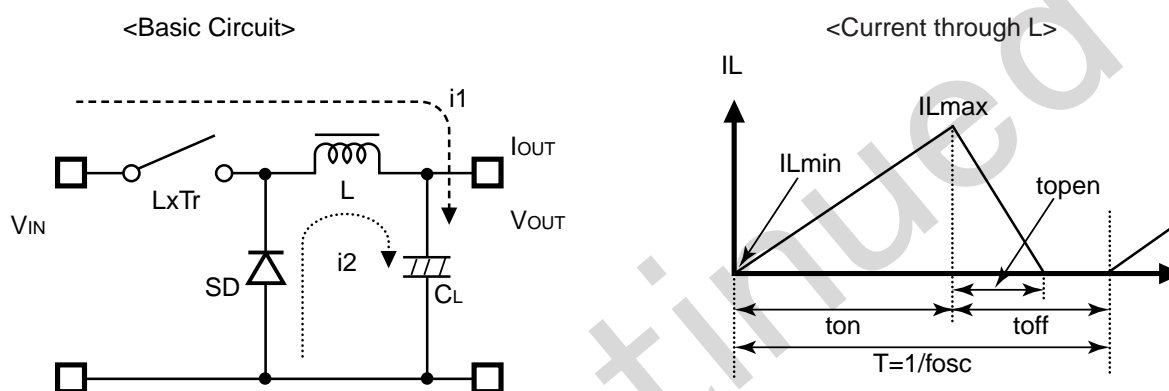

When you use these ICs, consider the following issues;

- As shown in the block diagram, a parasitic diode is formed in each terminal, each of these diodes is not formed for load current, therefore do not use it in such a way. When you control the CE pin by another power supply, do not make its “H” level more than the voltage level of V_{IN} pin.
- Detector threshold hysteresis is set at 3 percent of detector threshold voltage. (Min. 1 percent, Max. 5 percent)
- Setting detector threshold voltage range depends on Output voltage of DC/DC converter.
Release Voltage from Reset condition must not be more than Output voltage of DC/DC converter.
(Detector Threshold Voltage \times 1.07 < Output Voltage of DC/DC converter \times 0.98)
- When the R1221Nxxxx is on stand-by mode, the output voltage of V_{DOUT} is GND level, therefore if the pull-up resistor for V_{DOUT} pin is pulled up another power supply, a certain amount of current is loading through the resistor.
- The operation of latch-type protection circuit is as follows;
When the maximum duty cycle continues longer than the delay time for protection circuit, (Refer to the Electrical Characteristics) the protection circuit works to shut-down the external Power MOS with its latching operation.
Therefore when an input/output voltage difference is small, the protection circuit may work even at small load current.
To release the protection state, after disable this IC with a chip enable circuit, enable it again, or restart this IC with power-on. However, in the case of restarting this IC with power-on, after the power supply is turned off, if a certain amount of charge remains in C_{IN} , or some voltage is forced to V_{IN} from C_{IN} , this IC might not be restarted even after power-on.
If rising transition speed of supply voltage is too slow, or the time which is required for V_{IN} voltage to reach the output voltage of DC/DC converter is longer than soft-starting time plus delay time for protection circuit, protection circuit works before V_{IN} voltage reaches Output Voltage of DC/DC converter. To avoid this condition, make this IC disable (CE=“L”) first, then force V_{IN} voltage, and after V_{IN} voltage becomes equal or more than V_{OUT} , make this IC enable (CE=“H”).
- Set external components as close as possible to the IC and minimize the connection between the components and the IC. In particular, a capacitor should be connected to V_{OUT} pin with the minimum connection. And make sufficient grounding and reinforce supplying. A large switching current flows through the connection of power supply, an inductor and the connection of V_{OUT} . If the impedance of power supply line is high, the voltage level of power supply of the IC fluctuates with the switching current. This may cause unstable operation of the IC.
- Use capacitors with a capacity of $22\mu\text{F}$ or more for V_{OUT} Pin, and with good high frequency characteristics such as tantalum capacitors. We recommend you to use capacitors with an allowable voltage which is at least twice as much as setting output voltage. This is because there may be a case where a spike-shaped high voltage is generated by an inductor when an external transistor is on and off.
- Choose an inductor that has sufficiently small DC resistance and large allowable current and is hard to reach magnetic saturation. And if the value of inductance of an inductor is extremely small, the I_{LX} may exceed the absolute maximum rating at the maximum loading.
Use an inductor with appropriate inductance.
- Use a diode of a Schottky type with high switching speed, and also pay attention to its current capacity.
- Do not use this IC under the condition at V_{IN} voltage less than minimum operating voltage.

- ☆ The performance of power source circuits using these ICs extremely depends upon the peripheral circuits. Pay attention in the selection of the peripheral circuits. In particular, design the peripheral circuits in a way that the values such as voltage, current, and power of each component, PCB patterns and the IC do not exceed their respected rated values.

OPERATION of Step-down DC/DC Converter and Output Current

The step-down DC/DC converter charges energy in the inductor when Lx transistor is ON, and discharges the energy from the inductor when Lx transistor is OFF and controls with less energy loss, so that a lower output voltage than the input voltage is obtained. The operation will be explained with reference to the following diagrams :

Step 1 :LxTr turns on and current $IL (=i1)$ flows, and energy is charged into CL. At this moment, IL increases from $ILmin (=0)$ to reach $ILmax$ in proportion to the on-time period (ton) of LX Tr.

Step 2 :When Lx Tr turns off, Schottky diode (SD) turns on in order that L maintains IL at $ILmax$, and current $IL (=i2)$ flows.

Step 3 : IL decreases gradually and reaches $ILmin$ after a time period of $topen$, and SD turns off, provided that in the continuous mode, next cycle starts before IL becomes to 0 because $toff$ time is not enough. In this case, IL value increases from this $ILmin(>0)$.

In the case of PWM control system, the output voltage is maintained by controlling the on-time period (ton), with the oscillator frequency ($fosc$) being maintained constant.

• Discontinuous Conduction Mode and Continuous Conduction Mode

The maximum value ($ILmax$) and the minimum value ($ILmin$) of the current which flows through the inductor are the same as those when LxTr is ON and when it is OFF.

The difference between $ILmax$ and $ILmin$, which is represented by ΔI ;

$$\Delta I = ILmax - ILmin = V_{OUT} \times topen / L = (V_{IN} - V_{OUT}) \times ton / L \dots \dots \dots \text{Equation 1}$$

wherein $T = 1/f_{osc} = t_{on} + t_{off}$

$$\text{duty (\%)} = t_{on}/T \times 100 = t_{on} \times f_{osc} \times 100$$

$$t_{open} \leq t_{off}$$

In Equation 1, $V_{OUT} \times t_{open}/L$ and $(V_{IN} - V_{OUT}) \times t_{on}/L$ respectively show the change of the current at ON, and the change of the current at OFF.

When the output current (I_{OUT}) is relatively small, $t_{open} < t_{off}$ as illustrated in the above diagram. In this case, the energy is charged in the inductor during the time period of t_{on} and is discharged in its entirety during the time period of t_{off} , therefore I_{Lmin} becomes to zero ($I_{Lmin} = 0$). When I_{OUT} is gradually increased, eventually, t_{open} becomes to t_{off} ($t_{open} = t_{off}$), and when I_{OUT} is further increased, I_{Lmin} becomes larger than zero ($I_{Lmin} > 0$). The former mode is referred to as the discontinuous mode and the latter mode is referred to as continuous mode.

In the continuous mode, when Equation 1 is solved for t_{on} and assumed that the solution is t_{onc} ,

$$t_{onc} = T \times V_{OUT}/V_{IN} \dots\dots\dots \text{Equation 2}$$

When $t_{on} < t_{onc}$, the mode is the discontinuous mode, and when $t_{on} = t_{onc}$, the mode is the continuous mode.

Output Current and Selection of External Components

When LxTr is ON:

(Wherein, Ripple Current P-P value is described as I_{RP} , ON resistance of LxTr is described as R_p the direct current resistance of the inductor is described as R_L .)

$$V_{IN} = V_{OUT} + (R_p + R_L) \times I_{OUT} + L \times I_{RP}/t_{on} \dots\dots\dots \text{Equation 3}$$

When LxTr is OFF:

$$L \times I_{RP}/t_{off} = V_F + V_{OUT} + R_L \times I_{OUT} \dots\dots\dots \text{Equation 4}$$

Put Equation 4 to Equation 3 and solve for ON duty, $t_{on}/(t_{off} + t_{on}) = D_{ON}$,

$$D_{ON} = (V_{OUT} + V_F + R_L \times I_{OUT}) / (V_{IN} + V_F - R_p \times I_{OUT}) \dots\dots\dots \text{Equation 5}$$

Ripple Current is as follows;

$$I_{RP} = (V_{IN} - V_{OUT} - R_p \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON} / f \dots\dots\dots \text{Equation 6}$$

wherein, peak current that flows through L, LxTr, and SD is as follows;

$$I_{Lmax} = I_{OUT} + I_{RP}/2 \dots\dots\dots \text{Equation 7}$$

Consider I_{Lmax} , condition of input and output and select external components.

★ The above explanation is directed to the calculation in an ideal case in continuous mode.

External Components

1. Inductor

Select an inductor that peak current does not exceed I_{Lmax} . If larger current than allowable current flows, magnetic saturation occurs and make transform efficiency worse.

When the load current is same, the smaller value of L is used, the larger the ripple current is.

Provided that the allowable current is large in that case and DC current is small, therefore, for large output current, efficiency is better than using an inductor with a large value of L and vice versa,

2. Diode

Use a diode with low V_F (Schottky type is recommended.) and high switching speed.

Reverse voltage rating should be more than V_{IN} and current rating should be equal or more than I_{Lmax} .

3. Capacitor

As for C_{IN} , use a capacitor with low ESR (Equivalent Series Resistance) and a capacity of at least $10\mu F$ for stable operation. C_{OUT} can reduce ripple of Output Voltage, therefore 47 to $100\mu F$ tantalum type is recommended.

4. Lx Transistor

Pch Power MOS FET is required for this IC.

Its breakdown voltage between gate and source should be a few volt higher than the input voltage.

In the case of the input voltage is low, to turn on MOS FET completely, select a MOS FET with low threshold voltage.

If a large load current is necessary for your application and important, choose a MOS FET with low ON resistance for good efficiency.

If a small load current is mainly necessary for your application, choose a MOS FET with low gate capacity for good efficiency.

Maximum continuous drain current of MOS FET should be larger than peak current, I_{Lmax} .

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact Ricoh sales or our distributor before attempting to use AOI.
11. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.

Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.
