The RCA-CD54/74HC42 and CD54/74HCT42 BCD-to-Decimal Decoders utilize silicon-gate CMOS technology to achieve operating speeds similar to LSTTL decoders with the low power consumption of standard CMOS integrated circuits. These devices have the capability of driving 10 LSTTL loads and are compatible with the standard 54LS/74LS logic family. One of ten outputs (low on select) is selected in accordance with the BCD input. Non-valid BCD inputs result in none of the outputs being selected (all outputs are high).

The CD54HC42 and CD54HCT42 are supplied in 16-lead hermetic dual-in-line ceramic packages (F suffix). The CD74HC42 and CD74HCT42 are supplied in 16-lead dual-in-line plastic packages (E suffix), and in 16-lead dual-in-line surface mount plastic packages (M suffix). Both types are also available in chip form (H suffix).

$P_D = V_{CC}^2 f_i (C_{PD} + C_L)$  where:

$f_i$  = Input frequency.

$C_L$  = output load capacitance.
