TC74VCX16601FT

Low-Voltage 18-Bit Universal Bus Transceiver with 3.6-V Tolerant Inputs and Outputs

The TC74VCX16601FT is a high performance CMOS 18-bit universal bus transceiver. Designed for use in 1.8-V, 2.5-V or 3.3-V systems, it achieves high-speed operation while maintaining the CMOS low power dissipation.

It is also designed with overvoltage tolerant inputs and outputs up to 3.6 V.

Data flow in each direction is controlled by output-enable (\overline{OEAB} and \overline{OEBA}), latch-enable (\overline{LEAB} and \overline{LEBA}), and clock (\overline{CKAB} and \overline{CKBA}) inputs. The clock can be controlled by the clock-enable (\overline{CKENAB} and \overline{CKENBA}) inputs.

For A-to-B data flow, the device operates in the transparent mode when \overline{LEAB} is high. When \overline{LEAB} is low, the A data is latched if \overline{CKAB} is held at a high or low logic level. If \overline{LEAB} is low, the A-bus data is stored in the latch/flip-flop on the low-to-high transition of \overline{CKAB} .

Data flow for B to A is similar to that of A to B but uses \overline{OEBA} , \overline{LEBA} , \overline{CKBA} , and \overline{CKENBA} .

When the \overline{OE} input is high, the outputs are in a high-impedance state. This device is designed to be used with 3-state memory address drivers, etc.

All inputs are equipped with protection circuits against static discharge.

Weight: 0.25 g (typ.)

Note 1: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.

Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.

Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/"Derating Concept and Methods") and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

Note 2: OFF state

Note 3: High or low state. I_{OUT} absolute maximum rating must be observed.
