DESCRIPTION:

The FCT823T series is built using an advanced dual metal CMOS technology. The FCT823T series bus interface registers are designed to eliminate the extra packages required to buffer existing registers and provide extra data width for wider address/data paths or buses carrying parity. The FCT823T are 9-bit wide buffered registers with Clock Enable (EN) and Clear (CLR) – ideal for parity bus interfacing in high-performance microprogrammed systems.

The FCT823T high-performance interface family can drive large capacitive loads, while providing low-capacitance bus loading at both inputs and outputs. All inputs have clamp diodes and all outputs are designed for low-capacitance bus loading in high-impedance state.

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability. No terminal voltage may exceed VCC by +0.5V unless otherwise noted.

PIN DESCRIPTION

Names	I/O	Description
Di	I	The D flip-flop data inputs.
CLR	I	When the clear input is LOW and OE is LOW, the Qi outputs are LOW. When the clear input is HIGH, data can be entered into the register.
CP	I	Clock Pulse for the Register; enters data into the register on the LOW-to-HIGH transition.
Yi	O	The register 3-state outputs.
EN	I	Clock Enable. When the clock enable is LOW, data on the Di input is transferred to the Qi output on the LOW-to-HIGH clock transition. When the clock enable is HIGH, the Qi outputs do not change state, regardless of the data or clock input transitions.
OE	I	Output Control. When the OE input is HIGH, the Yi outputs are in the high-impedance state. When the OE input is LOW, the TRUE register data is present at the Yi outputs.
