# Z8581 Military Clock Generator and Controller

T-50-23

Zilog

# Military Electrical Specification

July 1985

## **FEATURES**

- Two independent 20 MHz oscillators generate two 10 MHz clock outputs and one 20 MHz clock output.
- Oscillator input frequency sources can be either crystals or external oscillators.
- Outputs directly drive the Z80, Z8000, 8086, 8088, and 68000 microprocessor clock inputs.
- Can be used as a general-purpose clock generator.
- 18-pin slimline package used; single +5V dc power required.
- Provides ability to stretch High and/or Low phase of clock signal under external control.
  - On-chip 2-bit counter can be used to selectively stretch clock cycles.
- On-chip reset logic
  - Reset output is synchronized with System Clock output.
  - Power-up reset period is maintained for a minimum of 30 ms.
  - □ External input initiates system reset.

#### **GENERAL DESCRIPTION**

The Z8581 Clock Generator and Controller is a versatile addition to Zilog's family of Universal microprocessor components. The selective clock-stretching capabilities and variety of timing outputs produced by this device allow it to easily meet the timing design requirements of systems with microprocessors and LSI peripherals. The clock output drivers of the Z8581 also meet the non-TTL voltage requirements for driving NMOS clock inputs with no

additional external components. The Z8581 provides an elegant, single-chip solution to the design of system clocks for microprocessor-based products.

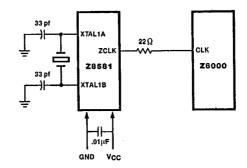

The Z8581 oscillators are referenced as the system clock oscillator and the general-purpose clock oscillator. Both oscillators are driven by external crystals or other frequency sources.

Figure 1. Z8581 Functional Block Diagram

## SYSTEM INTERFACE CONSIDERATIONS

Due to the fast rise and fall times produced by the Z8581, transmission line concepts must be applied in order to avoid ringing and reflections on the clock outputs. More specifically, the interconnections between the clock outputs and the loads they are driving must be treated as transmission lines, and it is necessary to match the source impedance of the clock outputs to the characteristic impedances of these transmission lines. In most cases the impedances can be matched by placing termination resistors in series with the clock outputs. These resistors range in value from 22 to 220 ohms, with the value chosen to optimize the clock risetime at the load. (See Figure 2.) It is important to control the impedance seen by the clock output by keeping leads short and avoiding stray inductances wherever possible.

Another important consideration is the bypass capacitor. To avoid distortion of the power supply, the Z8581 requires a high frequency 0.01  $\mu\text{F}$  ceramic capacitor between VCC and ground, and the leads connecting this capacitor to the pins should be kept as short as possible.

NOTE: The Z8581 requires a parallel-resonant fundamental type crystal. The capacitor may be varied to fine tune the frequency.

#### **ABSOLUTE MAXIMUM RATINGS**

Guaranteed by design and characterization.

T-50-23

Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; operation of the device at any condition above those indicated in the operational sections of these specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

#### STANDARD TEST CONDITIONS

The DC Characteristics and Capacitance sections listed below apply for the following standard test conditions, unless otherwise noted.

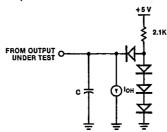

Military Operating Temperature Range (T<sub>C</sub>) -55°C to +125°C

Standard Military Test Condition +  $4.5V \le V_{CC} \le +5.5V$ 

All voltages are referenced to GND (OV). Positive current flows into the referenced pin.

All ac parameters assume a total load capacitance (C), including parasitic capacitances, of 100 pf max, except for

parameters 8, 9, 21, and 22 which are 200 pf max. Timing references between two output signals assume a load difference of 50 pf max.

Timing measurements are made at the following voltages:

| ······································ | High | Low  |
|--|------|------|
| ZCLK, TCLK                             | 4.0V | 0.8V |
| Output                                 | 2.0V | V8.0 |
| Input                                  | 2.0V | V8.0 |

#### **PIN DESCRIPTIONS**

Figures 3 and 4, respectively, show the pin functions and assignments of the Z8581. Tie unused inputs High through a resistor.

ADD1, ADD2. Add Delay 1 (input, active Low) and Add Delay 2 (input, active Low). These signals control the addition of one, two, or three delay periods to a selected half-cycle of the ZCLK output.

**C0, C1.** ZCLK Count 0 (output, active High) and ZCLK Count 1 (output, active High). These signals indicate, in binary, the number or rising edges of ZCLK that have occurred after the assertion of the STRT input.

**INH.** Inhibit Delay (input, active Low). When asserted, this signal inhibits the functions of inputs ADD1 and ADD2.

**DSC.** Time Base Clock (output, active High). This signal provides a TTL-compatible clock output at the same frequency as the system clock frequency source.

**RSTI.** Reset In (input, active Low). When asserted, this signal indicates a reset condition and initiates the assertion of RSTO synchronized with ZCLK.

**RSTO.** Reset Out (output, active Low). When asserted, this signal indicates that a system reset condition is required, either by RSTI going Low or by a system powerup condition.

**STRT.** Start Count (input, negative edge-triggered). When asserted, this signal resets a two-bit binary counter and then enables the counter to count the rising edges of the ZCLK output.

T-50-23

**STRH.** Delay ZCLK (input, active Low). When asserted, this signal causes the current half-cycle of the ZCLK output to be delayed (stretched) for as long as STRH is held Low. This control input overrides the ADD1, ADD2, and INH functions.

**TCLK.** General-Purpose Clock (output, MOS-compatible, active High). This signal is the timing output of the general-purpose oscillator. TCLK's frequency is half that of the external oscillator used to drive the general purpose oscillator.

XTAL1A, XTAL1B. System Clock Frequency Source A (input, active High) and System Clock Frequency Source B (output, active High). These signals are used by the external oscillator to drive the internal system clock oscillator and the OSC output.

**XTAL2A, XTAL2B.** General-Purpose Clock Frequency Source A (input, active High) and General-Purpose Clock Frequency Source B (output, active High). These signals are used by the external oscillator to drive the internal general-purpose clock oscillator.

**ZCLK.** System Clock (output, MOS-compatible, active High). This signal is the timing output of the system clock oscillator. This clock can be modified by the delay (stretch) control inputs. Its frequency, when unmodified, is half that of the external system clock frequency source.

| Subgroup 11 | Switching/AC | -55°C                         | 5                      |

#### NOTES:

The specific parameters to be included for tests in each subgroup shall be as specified in the applicable detail electrical specification. Where no parameters have been identified in a particular subgroup or test within a subgroup, no Group A testing is required for that subgroup or test.
A single sample may be used for all subgroup testing. Where required size exceeds the lot size, 100% inspection shall be allowed.
Group A testing by subgroup or within subgroups may be performed in any sequence unless otherwise specified.

# NOTES:

- NOTES:

  1. Number of leads inspected selected from a minimum of 3 devices.
  2. Number of bond pulls selected from a minimum of 4 devices.
  3. Test applicable only if the package contains a dessicant.
  4. Test not required if either 100% or sample seal test is performed between final electrical tests and external visual during Class B screening.
  5. Test required for initial qualification and product redesign.

## NOTES:

- L. Lead Integrity Condition D for leadless chip carriers.
   Applies to larger packages which have an inner seal or cavity perimeter of two inches or more in total length or have a package mass of ≥5 grams.
- 3. Not applicable to leadless chip carriers.4. LTPD based on number of leads.
- 5. Not applicable for solder seal packages.
