

1024 x 8 Dual-Port
Static RAM

Features

- 0.8-micron CMOS for optimum speed/power
- Automatic power-down
- TTL-compatible
- Capable of withstanding greater than 2001V electrostatic discharge
- Fully asynchronous operation
- Master CY7C130/CY7C131 easily expands data bus width to 16 or more bits using SLAVE CY7C140/CY7C141
- BUSY output flag on CY7C130/CY7C131; BUSY input on CY7C140/CY7C141
- INT flag for port-to-port communication

Functional Description

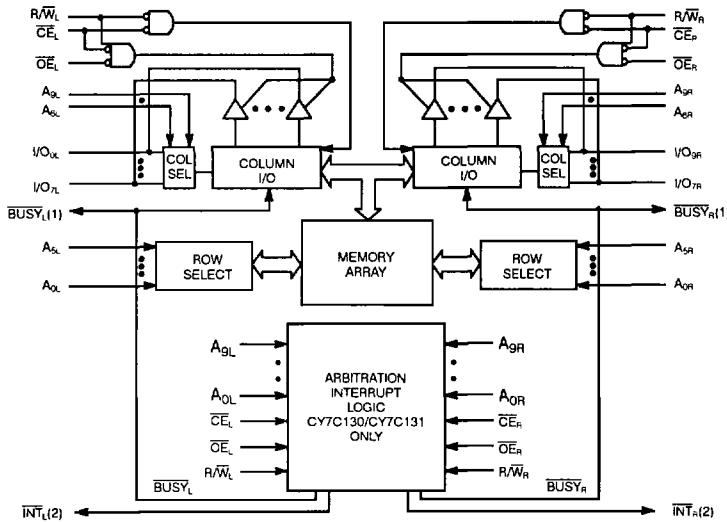

The CY7C130/CY7C131/CY7C140/CY7C141 are high-speed CMOS 1K by 8 dual-port static RAMs. Two ports are provided permitting independent access to any location in memory. The CY7C130/CY7C131 can be utilized as either a standalone 8-bit dual-port static RAM or as a master dual-port RAM in conjunction with the CY7C140/CY7C141 slave dual-port device in systems requiring 16-bit or greater word widths. It is the solution to applications requiring shared or buffered data, such as cache memory for DSP, bit-slice, or multiprocessor designs.

Each port has independent control pins; chip enable (CE), write enable (WE), and output enable (OE). Two flags are provided on each port, BUSY and INT. BUSY signals that the port is trying to access the same location currently being accessed by the other port. INT is an interrupt flag indicating that data has been placed in a unique location by the other port. An automatic power-down feature is controlled independently on each port by the chip enable (CE) pin.

The CY7C130 and CY7C140 are available in both 48-pin DIP and 48-pin LCC. The CY7C131 and CY7C141 are available in both 52-pin LCC and PLCC.

A die coat is used to insure alpha immunity.

Logic Block Diagram

C130-1

Pin Configurations

C130-2

Notes:

1. CY7C130/CY7C131 (Master): BUSY is open drain output and requires pull-up resistor. CY7C140/CY7C141 (Slave): BUSY is input.
2. Open drain outputs: pull-up resistor required.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

- Storage Temperature - 65°C to + 150°C
- Ambient Temperature with Power Applied - 55°C to + 125°C
- Supply Voltage to Ground Potential (Pin 48 to Pin 24) - 0.5V to + 7.0V
- DC Voltage Applied to Outputs in High Z State - 0.5V to + 7.0V
- DC Input Voltage - 3.5V to + 7.0V
- Output Current into Outputs (Low) 20 mA

- Static Discharge Voltage > 2001V (per MIL-STD-883, Method 3015)
- Latch-Up Current > 200 mA

Operating Range

Range	Ambient Temperature	V _{CC}
Commercial	0°C to + 70°C	5V ± 10%
Military ^[3]	- 55°C to + 125°C	5V ± 10%

Capacitance^[7]

Parameters	Description	Test Conditions	Max.	Units
C _{IN}	Input Capacitance	T _A = 25°C, f = 1 MHz, V _{CC} = 5.0V	10	pF
C _{OUT}	Output Capacitance		10	pF

Notes:

- T_A is the "instant on" case temperature
- See the last page of this specification for Group A subgroup testing information.
- BUSY and INT pins only.
- Duration of the short circuit should not exceed 30 seconds.
- Tested initially and after any design or process changes that may affect these parameters.
- Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V and output loading of the specified I_{OL}/I_{OH}, and 30-pF load capacitance.
- t_{HZCE} and t_{HZWE} are tested with C_L = 5pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady state voltage.
- At any given temperature and voltage condition, t_{HZ} is less than t_{LZ} for any given device.
- The internal write time of the memory is defined by the overlap of CS LOW and WE LOW. Both signals must be low to initiate a write and either signal can terminate a write by going high. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.

Shaded area contains preliminary information.

Notes:

12. These parameters are measured from the input signal changing, until the output pin goes to a high-impedance state.
13. CY7C140/CY7C141 only.
14. A write operation on Port A, where Port A has priority, leaves the data on Port B's outputs undisturbed until one access time after one of the following:
 - A. BUSY on Port B goes HIGH.
 - B. Port B's address is toggled.
 - C. CE for Port B is toggled.
 - D. WE for Port B is toggled.
15. WE is HIGH for read cycle.
16. Device is continuously selected, CS = V_{IL} and OE = V_{IL}.
17. Address valid prior to or coincident with CE transition LOW.
18. Data I/O pins enter high-impedance state as shown, when OE is held LOW during write.
