description

This single 2-input positive-NAND gate is designed for 1.65-V to 3.6-V V_{CC} operation.

The SN74LVC1G00A performs the Boolean function $Y = \overline{A \bullet B}$ or $Y = \overline{A} + \overline{B}$ in positive logic.

Inputs can be driven from either 3.3-V or 5-V devices. This feature allows the use of this device as a translator in a mixed 3.3-V/5-V system environment.

The SN74LVC1G00A is characterized for operation from –40°C to 85°C.

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
 - 2. The value of V_{CC} is provided in the recommended operating conditions table.
 - 3. The package thermal impedance is calculated in accordance with JESD 51.
