

# Power Switching Regulators

The MC34165 series are monolithic power switching regulators that contain the primary functions required for DC-to-DC converters. This series is specifically designed to be incorporated in step-up, step-down, and voltage-inverting applications with a minimum number of external components.

These devices consist of two high gain voltage feedback comparators, temperature compensated reference, controlled duty cycle oscillator, driver with bootstrap capability for increased efficiency, and a high current output switch. Protective features consist of cycle-by-cycle current limiting, and internal thermal shutdown. Also included is a low voltage indicator output designed to interface with microprocessor based systems.

These devices are contained in a 16 pin dual-in-line heat tab plastic package for improved thermal conduction.

- Output Switch Current in Excess of 1.5 A
- Operation from 3.0 V to 65 V Input
- Low Standby Current
- Precision 2% Reference
- Controlled Duty Cycle Oscillator
- Driver with Bootstrap Capability for Increased Efficiency
- Cycle-by-Cycle Current Limiting
- Internal Thermal Shutdown Protection
- Low Voltage Indicator Output for Direct Microprocessor Interface
- Heat Tab Power Package

## INTRODUCTION

The MC34165 series are monolithic power switching regulators optimized for DC-to-DC converter applications. The combination of features in this series enables the system designer to directly implement step-up, step-down, and voltage-inverting converters with a minimum number of external components. This series is constructed on a special high voltage process making it ideal for telecommunication applications. Other potential applications include cost sensitive consumer products as well as equipment for the automotive, computer, and industrial markets. The Representative Block Diagram is shown in Figure 18.

## OPERATING DESCRIPTION

The MC34165 operates as a fixed on-time, variable off-time voltage mode ripple regulator. In general, this mode of operation is somewhat analogous to a capacitor charge pump and does not require dominant pole loop compensation for converter stability. The Typical Operating Waveforms are shown in Figure 19. The output voltage waveform shown is for a step-down converter, with the ripple and phasing exaggerated for clarity. During initial converter start-up, the feedback comparator senses that the output voltage level is below nominal. This causes the output switch to turn on and off at a frequency and duty cycle controlled by the oscillator, thus pumping up the output filter capacitor. When the output voltage level reaches nominal, the feedback comparator sets the latch, immediately terminating switch conduction. The feedback comparator will inhibit the switch until the load current causes the output voltage to fall below nominal. Under these conditions, output switch conduction can be inhibited for a partial oscillator cycle, a partial cycle plus a complete cycle, multiple cycles, or a partial cycle plus multiple cycles.

### Oscillator

The oscillator frequency and on-time of the output switch are programmed by the value selected for timing capacitor  $C_T$ . Capacitor  $C_T$  is charged and discharged by a 9 to 1 ratio internal current source and sink, generating a negative going sawtooth waveform at Pin 6. As  $C_T$  charges, an internal pulse is generated at the oscillator output. This pulse is connected to the NOR gate center input, preventing output switch conduction, and to the AND gate upper input, allowing the latch to be reset if the comparator output is low. Thus, the output switch is always disabled during ramp-up and can be enabled by the comparator output only at the start of ramp-down. The oscillator peak and valley thresholds are 1.25 V and 0.55 V, respectively, with a charge current of 225  $\mu$ A and a discharge current of 25  $\mu$ A, yielding a maximum on-time duty cycle of 90%. Since the MC34165 is a ripple mode regulator, the switch frequency will vary with line and load. The value selected for  $C_T$  will set the maximum switching frequency of the converter. A reduction of the maximum duty cycle may be required for specific converter configurations. This can be accomplished with the addition of an external dead-time resistor ( $R_{DT}$ ) placed across  $C_T$ . The resistor increases the discharge current which reduces the on-time of the output switch. A graph of the Output Switch On-Off Time versus Oscillator Timing Capacitance for

various values of  $R_{DT}$  is shown in Figure 1. Note that the maximum output duty cycle,  $t_{on}/t_{on} + t_{off}$ , remains constant for values of  $C_T$  greater than 0.2 nF. The converter output can be inhibited by clamping  $C_T$  to ground with an external NPN small-signal transistor.

### Feedback and Low Voltage Indicator Comparators

Output voltage control is established by the Feedback comparator. The inverting input is internally biased at 1.25 V and is not pinned out. The converter output voltage is typically divided down with two external resistors and monitored by the high impedance noninverting input at Pin 2. The maximum input bias current is  $\pm 0.4 \mu$ A, which can cause an output voltage error that is equal to the product of the input bias current and the upper divider resistance value. For applications that require 5.0 V, the converter output can be directly connected to the noninverting input at Pin 3. The high impedance input, Pin 2, must be grounded to prevent noise pickup. The internal resistor divider is set for a nominal voltage of 5.05 V. The additional 50 mV compensates for a 1.0% voltage drop in the cable and connector from the converter output to the load. The Feedback comparator's output state is controlled by the highest voltage applied to either of the two noninverting inputs.

The Low Voltage Indicator (LVI) comparator is designed for use as a reset controller in microprocessor-based systems. The inverting input is internally biased at 1.125 V, which sets the noninverting input thresholds to 90% of nominal. The LVI comparator has 15 mV of hysteresis to prevent erratic reset operation. The open collector output is capable of sinking in excess of 1.5 mA (see Figure 10). An external resistor ( $R_{LVI}$ ) and capacitor ( $C_{DLY}$ ) can be used to program a reset delay time ( $t_{DLY}$ ) by the formula shown below, where  $V_{th}(MPU)$  is the microprocessor reset input threshold.

$$t_{DLY} = R_{LVI} C_{DLY} \ln \left( \frac{1}{1 - \frac{V_{th}(MPU)}{V_{out}}} \right)$$

### Current Limit Comparator, Latch and Thermal Shutdown

With a voltage mode ripple converter operating under normal conditions, output switch conduction is initiated by the oscillator and terminated by the Voltage Feedback comparator. Abnormal operating conditions occur when the converter output is overloaded or when feedback voltage sensing is lost. Under these conditions, the Current Limit comparator will protect the Output Switch.

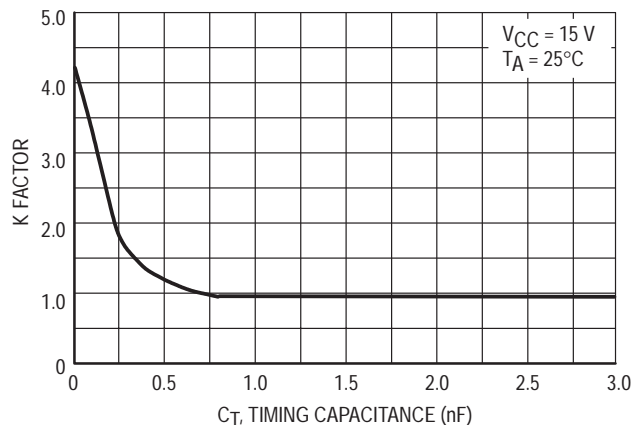

The switch current is converted to a voltage by inserting a fractional ohm resistor,  $R_{SC}$ , in series with  $V_{CC}$  and output switch transistor  $Q_2$ . The voltage drop across  $R_{SC}$  is monitored by the Current Sense comparator. If the voltage drop exceeds 250 mV with respect to  $V_{CC}$ , the comparator will set the latch and terminate output switch conduction on a cycle-by-cycle basis. This Comparator/Latch configuration ensures that the Output Switch has only a single on-time during a given oscillator cycle. The calculation for a value of  $R_{SC}$  is:

$$R_{SC} = \frac{0.25 \text{ V} \cdot K}{I_{pk}(\text{Switch})}$$

The K factor was added to the previous equation in order to account for a 200 ns propagation delay that occurs from the Current Limit comparator input to the output switch. This propagation delay can cause the actual peak switch current to rise above the calculated peak switch current for small values of  $C_T$ . The following figure shows the relationship of the ratio  $I_{pk(actual)}/I_{pk(Switch)}$ , expressed as K versus  $C_T$ . Note the ratio rises above 1.0 for  $C_T$  values less than 1.0 nF.

**Figure 20. K Factor versus Timing Capacitance**

**When analyzing a design, the actual short circuit current must be measured to verify that it is less than the maximum rating of the device.**

Figures 11 and 12 show that the Current Sense comparator threshold is tightly controlled over temperature and has a typical input bias current of 1.0  $\mu$ A. The parasitic inductance associated with  $R_{SC}$  and the circuit layout should be minimized. This will prevent unwanted voltage spikes that may falsely trip the Current Limit comparator.

Internal thermal shutdown circuitry is provided to protect the IC in the event that the maximum junction temperature is exceeded. When activated, typically at 170°C, the Latch is forced into the “Set” state, disabling the Output Switch. This feature is provided to prevent catastrophic failures from accidental device overheating. It is not intended to be used as a replacement for proper heatsinking.

#### Driver and Output Switch

To aid in system design flexibility and conversion efficiency, the driver current source and collector, and output switch collector and emitter are pinned out separately. This allows the designer the option of driving the output switch into saturation with a selected force gain or driving it near saturation when connected as a Darlington. The output switch is designed to switch a maximum of 65 V collector to emitter, with up to 1.5 A peak collector current. The minimum value for  $R_{SC}$  is:

$$R_{SC(min)} = \frac{0.25 \text{ V}}{1.5 \text{ A}} = 0.166 \Omega$$

When configured for step-down or voltage-inverting applications, as in Figures 20 and 24, the inductor will forward

bias the output rectifier when the switch turns off. Rectifiers with a high forward voltage drop or long turn-on delay time should not be used. If the emitter is allowed to go sufficiently negative, collector current will flow, causing additional device heating and reduced conversion efficiency.

Figure 9 shows that by clamping the emitter to less than 0.5 V, the collector current will be in the range 10  $\mu$ A over temperature. A MBR160 or equivalent Schottky barrier rectifier is recommended to fulfill these requirements.

A bootstrap input is provided to reduce the output switch saturation voltage in step-down and voltage-inverting converter applications. This input is connected through a series resistor and capacitor to the switch emitter and is used to raise the internal 2.0 mA bias current source above  $V_{CC}$ . An internal zener limits the bootstrap input voltage to  $V_{CC} + 7.0$  V. The capacitor's equivalent series resistance may be large enough to limit the zener current to less than the maximum 100 mA rating. However, in most high voltage applications, an additional series resistor will probably be required. It is recommended that this resistor limit the zener current to approximately 25 mA for optimal performance. The circuit can be optimized by adjusting the zener current ( $R_B$ ) during operation, while observing the circuit's efficiency. The value of the series resistor can be calculated as follows:

$$R_B \approx \frac{V_{in(max)}}{I_Z}$$

The equation below is used to calculate a minimum value bootstrap capacitor based on a minimum zener voltage and an upper limit current source.

$$C_{B(min)} = I \frac{\Delta t}{\Delta V} = 4.0 \text{ mA} \frac{t_{on}}{4.0 \text{ V}} = 0.001 t_{on}$$

Parametric operation of the MC34165 is guaranteed over a supply voltage range of 3.0 V to 65 V. When operating below 3.0 V, the Bootstrap Input should be connected to  $V_{CC}$ . Figure 15 shows that non-parametric operation down to 1.7 V at room temperature is possible.

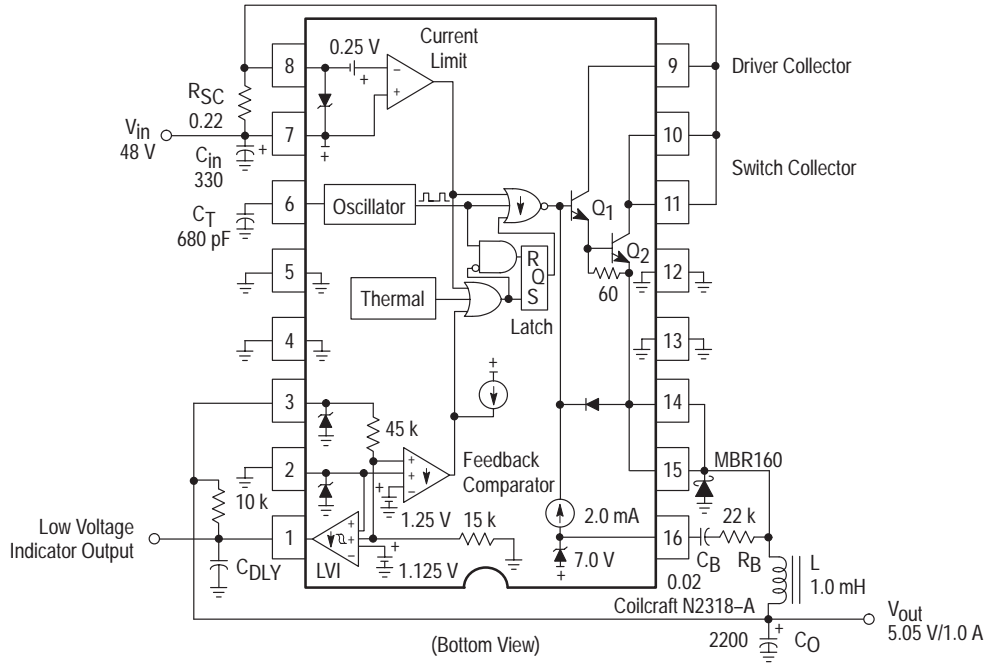

#### Package

The MC34165 is contained in a heatsinkable 16-lead plastic dual-in-line power package in which the die is mounted on a special heat tab copper alloy lead frame. This tab consists of the four center ground pins that are specifically designed to improve thermal conduction from the die to the circuit board. Figures 16 and 17 show a simple and effective method of utilizing the printed circuit board medium as a heat dissipater by soldering these pins to an adequate area of copper foil. This permits the use of standard layout and mounting practices while having the ability to halve the junction-to-air thermal resistance. These examples are for a symmetrical layout on a single-sided board with two ounce per square foot of copper.

#### APPLICATIONS

The following converter applications show the simplicity and flexibility of this circuit architecture. Three main converter topologies are demonstrated with actual test data shown below each of the circuit diagrams.

**The following Converter Characteristics must be chosen:**

- $V_{in}$  – Nominal operating input voltage.
- $V_{out}$  – Desired output voltage.
- $I_{out}$  – Desired output current.
- $\Delta I_L$  – Desired peak-to-peak inductor ripple current. For maximum output current, it is suggested that  $\Delta I_L$  be chosen to be less than 10% of the average inductor current  $I_{L(avg)}$ . This will help prevent  $I_{pk} \text{ (Switch)}$  from reaching the current threshold set by  $R_{SC}$ . If the design goal is to use a minimum inductance value, let  $\Delta I_L = 2(I_{L(avg)})$ . This will proportionally reduce converter output current capability.
- $f$  – Maximum output switch frequency.
- $V_{ripple(p-p)}$  – Desired peak-to-peak output ripple voltage. For best performance, the ripple voltage should be kept to a low value since it will directly affect line and load regulation. Capacitor  $C_O$  should be a low equivalent series resistance (ESR) electrolytic designed for switching regulator applications.
- $K$  – Multiplier number as determined by Figure 20, for determining the appropriate value for  $R_{SC}$ .

**NOTES:** 1.  $V_{sat}$  – Saturation voltage of the output switch, refer to Figures 7 and 8.

2.  $V_F$  – Output rectifier forward voltage drop. Typical value for MBR160 Schottky barrier rectifier is 0.6 V.

3. The calculated  $t_{on}/t_{off}$  must not exceed the minimum guaranteed oscillator charge to discharge ratio of 8, at the minimum operating input voltage.

# Tape and Reel Options

---

## In Brief . . .

Motorola offers the convenience of Tape and Reel packaging for our growing family of standard integrated circuit products. Reels are available to support the requirements of both first and second generation pick-and-place equipment. The packaging fully conforms to the latest EIA-481A specification. The antistatic embossed tape provides a secure cavity, sealed with a peel-back cover tape.

# Packaging Information

---

## In Brief . . .

*The packaging availability for each device type is indicated on the individual data sheets and the Selector Guide. All of the outline dimensions for the packages are given in this section.*

*The maximum power consumption an integrated circuit can tolerate at a given operating ambient temperature can be found from the equation:*

$$P_{D(TA)} = \frac{T_{J(max)} - T_A}{R_{\theta JA(Typ)}}$$

*where:*

$P_{D(TA)}$  = *Power Dissipation allowable at a given operating ambient temperature. This must be greater than the sum of the products of the supply voltages and supply currents at the worst case operating condition.*

$T_{J(max)}$  = *Maximum operating Junction Temperature as listed in the Maximum Ratings Section. See individual data sheets for  $T_{J(max)}$  information.*

$T_A$  = *Maximum desired operating Ambient Temperature*

$R_{\theta JA(Typ)}$  = *Typical Thermal Resistance Junction-to-Ambient*

- NOTES:  
 1. DATUMS -L-, -M-, AND -N- DETERMINED WHERE TOP OF LEAD SHOULDER EXITS PLASTIC BODY AT MOLD PARTING LINE.  
 2. DIMENSION G1, TRUE POSITION TO BE MEASURED AT DATUM -T-, SEATING PLANE.  
 3. DIMENSIONS R AND U DO NOT INCLUDE MOLD FLASH. ALLOWABLE MOLD FLASH IS 0.010 (0.250) PER SIDE.  
 4. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.  
 5. CONTROLLING DIMENSION: INCH.  
 6. THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM BY UP TO 0.012 (0.300). DIMENSIONS R AND U ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY EXCLUSIVE OF MOLD FLASH, TIE BAR BURRS, GATE BURRS AND INTERLEAD FLASH, BUT INCLUDING ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY.  
 7. DIMENSION H DOES NOT INCLUDE DAMBAR PROTRUSION OR INTRUSION. THE DAMBAR PROTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE GREATER THAN 0.037 (0.940). THE DAMBAR INTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE SMALLER THAN 0.025 (0.635).

**NOTES:**

- DATUMS -L-, -M-, AND -N- DETERMINED WHERE TOP OF LEAD SHOULDER EXITS PLASTIC BODY AT MOLD PARTING LINE.
- DIMENSION G1, TRUE POSITION TO BE MEASURED AT DATUM -T-, SEATING PLANE.
- DIMENSIONS R AND U DO NOT INCLUDE MOLD FLASH. ALLOWABLE MOLD FLASH IS 0.010 (0.250) PER SIDE.
- DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
- CONTROLLING DIMENSION: INCH.
- THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM BY UP TO 0.012 (0.300). DIMENSIONS R AND U ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY EXCLUSIVE OF MOLD FLASH, TIE BAR BURRS, GATE BURRS AND INTERLEAD FLASH, BUT INCLUDING ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY.
- DIMENSION H DOES NOT INCLUDE DAMBAR PROTRUSION OR INTRUSION. THE DAMBAR PROTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE GREATER THAN 0.037 (0.940). THE DAMBAR INTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE SMALLER THAN 0.025 (0.635).

 ISSUE A

**NOTES:**

- DIMENSION AND TOLERANCING PER ANSI Y14.5M, 1982.
- CONTROLLING DIMENSION: MILLIMETER.
- DATUM PLANE -H- IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING LINE.
- DATUMS -A-, -B- AND -D- TO BE DETERMINED AT DATUM PLANE -H-.
- DIMENSIONS S AND V TO BE DETERMINED AT SEATING PLANE -C-.
- DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 (0.010) PER SIDE. DIMENSIONS A AND B DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE -H-.
- DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 (0.003) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.

DETAIL Y

FTA SUFFIX  
CASE 977-01  
Plastic Package  
ISSUE O

24 1

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DATUM PLANE -AB- IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING LINE.
4. DATUMS -T-, -U-, AND -Z- TO BE DETERMINED AT DATUM PLANE -AB-.
5. DIMENSIONS S AND V TO BE DETERMINED AT DATUM PLANE -AC-.
6. DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.250 (0.010) PER SIDE. DIMENSIONS A AND B DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE -AB-.
7. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. DAMBAR PROTRUSION SHALL NOT CAUSE THE D DIMENSION TO EXCEED 0.350 (0.014).
8. MINIMUM SOLDER PLATE THICKNESS SHALL BE 0.0076 (0.0003).
9. EXACT SHAPE OF EACH CORNER IS OPTIONAL.
