

Nonvolatile Static RAM

FEATURES

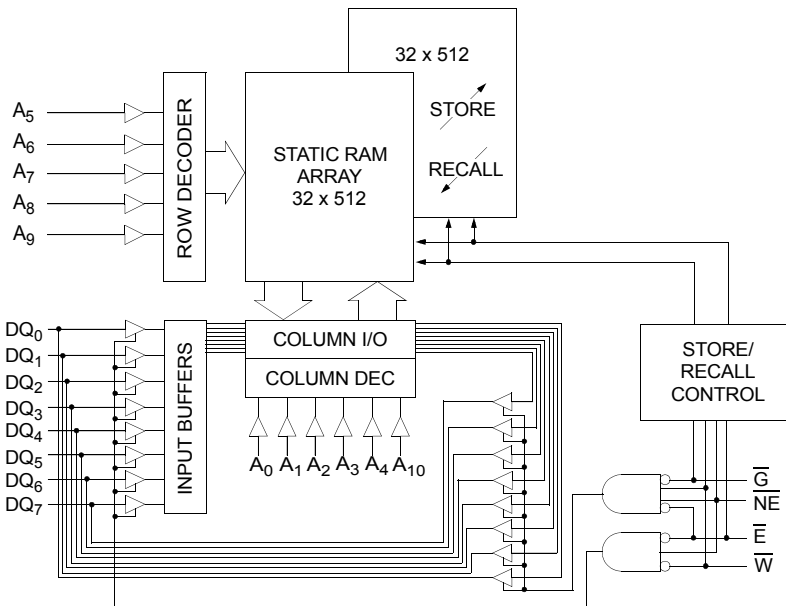

- 25ns, 35ns and 45ns Access Times
- **STORE** to Nonvolatile Elements Initiated by Hardware
- **RECALL** to SRAM Initiated by Hardware or Power Restore
- Automatic **STORE** Timing
- 10mA Typical I_{CC} at 200ns Cycle Time
- Unlimited **READ**, **WRITE** and **RECALL** Cycles
- 1,000,000 **STORE** Cycles to Nonvolatile Elements
- 100-Year Data Retention over Full Industrial Temperature Range
- Commercial and Industrial Temperatures
- 28-Pin 300 mil PDIP, 300 mil SOIC and 350 mil SOIC Packages

DESCRIPTION

The Force FTN16C8 is a fast static RAM with a non-volatile element incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times, while independent nonvolatile data resides in the Nonvolatile Elements. Data may easily be transferred from the SRAM to the Nonvolatile Elements (the **STORE** operation), or from the Nonvolatile Elements to the SRAM (the **RECALL** operation), using the **NE** pin. Transfers from the Nonvolatile Elements to the SRAM (the **RECALL** operation) also take place automatically on restoration of power. The FTN16C8 combines the high performance and ease of use of a fast SRAM with nonvolatile data integrity.

The FTN16C8 features industry-standard pinout for nonvolatile RAMs.

PIN NAMES

A ₀ - A ₁₀	Address Inputs
\bar{W}	Write Enable
DQ ₀ - DQ ₇	Data In/Out
\bar{E}	Chip Enable
\bar{G}	Output Enable
\bar{NE}	Nonvolatile Enable
V _{CC}	Power (+ 5V)
V _{SS}	Ground

ABSOLUTE MAXIMUM RATINGS^a

Voltage on Input Relative to Ground -0.5V to 7.0V
 Voltage on Input Relative to V_{SS} -0.6V to (V_{CC} + 0.5V)
 Voltage on DQ₀₋₇ -0.5V to (V_{CC} + 0.5V)
 Temperature under Bias -55°C to 125°C
 Storage Temperature -65°C to 150°C
 Power Dissipation 1W
 DC Output Current (1 output at a time, 1s duration) 15mA

Note a: Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC CHARACTERISTICS

(V_{CC} = 5.0V ± 10%)

SYMBOL	PARAMETER	COMMERCIAL		INDUSTRIAL		UNITS	NOTES
		MIN	MAX	MIN	MAX		
I _{CC1} ^b	Average V _{CC} Current		85 75 65		90 75 65	mA	t _{AVAV} = 25ns t _{AVAV} = 35ns t _{AVAV} = 45ns
I _{CC2} ^c	Average V _{CC} Current during STORE		3		3	mA	All Inputs Don't Care, V _{CC} = max
I _{CC3} ^b	Average V _{CC} Current at t _{AVAV} = 200ns 5V, 25°C, Typical		10		10	mA	$\bar{W} \geq (V_{CC} - 0.2V)$ All Others Cycling, CMOS Levels
I _{SB1} ^d	Average V _{CC} Current (Standby, Cycling TTL Input Levels)		25 21 18		26 22 19	mA	t _{AVAV} = 25ns, $\bar{E} \geq V_{IH}$ t _{AVAV} = 35ns, $\bar{E} \geq V_{IH}$ t _{AVAV} = 45ns, $\bar{E} \geq V_{IH}$
I _{SB2} ^d	V _{CC} Standby Current (Standby, Stable CMOS Input Levels)		750		750	µA	$\bar{E} \geq (V_{CC} - 0.2V)$ All Others V _{IN} ≤ 0.2V or ≥ (V _{CC} - 0.2V)

DEVICE OPERATION

The FTN16C8 has two modes of operation: SRAM mode and nonvolatile mode, determined by the state of the \overline{NE} pin. When in SRAM mode, the memory operates as a standard fast static RAM. While in nonvolatile mode, data is transferred in parallel from SRAM to Nonvolatile Elements or from Nonvolatile Elements to SRAM.

NOISE CONSIDERATIONS

Note that the FTN16C8 is a high-speed memory and so must have a high-frequency bypass capacitor of approximately 0.1 μ F connected between V_{CC} and V_{SS} , using leads and traces that are as short as possible. As with all high-speed CMOS ICs, normal careful routing of power, ground and signals will help prevent noise problems.

SRAM READ

The FTN16C8 performs a READ cycle whenever \overline{E} and \overline{G} are low and \overline{NE} and \overline{W} are high. The address specified on pins A_{0-10} determines which of the 2,048 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of t_{AVQV} (READ cycle #1). If the READ is initiated by \overline{E} or \overline{G} , the outputs will be valid at t_{ELQV} or at t_{GLQV} , whichever is later (READ cycle #2). The data outputs will repeatedly respond to address changes within the t_{AVQV} access time without the need for transitions on any control input pins, and will remain valid until another address change or until \overline{E} or \overline{G} is brought high or \overline{W} or \overline{NE} is brought low.

SRAM WRITE

A WRITE cycle is performed whenever \overline{E} and \overline{W} are low and \overline{NE} is high. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either \overline{E} or \overline{W} goes high at the end of the cycle. The data on pins DQ_{0-7} will be written into the memory if it is valid t_{DWH} before the end of a \overline{W} controlled WRITE or t_{DVEH} before the end of an \overline{E} controlled WRITE.

It is recommended that \overline{G} be kept high during the entire WRITE cycle to avoid data bus contention on the common I/O lines. If \overline{G} is left low, internal circuitry will turn off the output buffers t_{WLQZ} after \overline{W} goes low.

NONVOLATILE STORE

A STORE cycle is performed when \overline{NE} , \overline{E} and \overline{W} and low and \overline{G} is high. While any sequence that achieves this state will initiate a STORE, only \overline{W} initiation (STORE cycle #1) and \overline{E} initiation (STORE cycle #2) are practical without risking an unintentional SRAM WRITE that would disturb SRAM data. During a STORE cycle, previous nonvolatile data is erased and the SRAM contents are then programmed into nonvolatile elements. Once a STORE cycle is initiated, further input and output are disabled and the DQ_{0-7} pins are tri-stated until the cycle is complete.

If \overline{E} and \overline{G} are low and \overline{W} and \overline{NE} are high at the end of the cycle, a READ will be performed and the outputs will go active, signaling the end of the STORE.

NONVOLATILE RECALL

A RECALL cycle is performed when \overline{E} , \overline{G} and \overline{NE} are low and \overline{W} is high. Like the STORE cycle, RECALL is initiated when the last of the four clock signals goes to the RECALL state. Once initiated, the RECALL cycle will take t_{NLQX} to complete, during which all inputs are ignored. When the RECALL completes, any READ or WRITE state on the input pins will take effect.

Internally, RECALL is a two-step procedure. First, the SRAM data is cleared, and second, the nonvolatile information is transferred into the SRAM cells. The RECALL operation in no way alters the data in the nonvolatile cells. The nonvolatile data can be recalled an unlimited number of times.

As with the STORE cycle, a transition must occur on any one control pin to cause a RECALL, preventing inadvertent multi-triggering. On power up, once V_{CC} exceeds 4.25V, a RECALL cycle is automatically initiated. Due to this automatic RECALL, SRAM operation cannot commence until $t_{RESTORE}$ after V_{CC} exceeds 4.25V.

POWER-UP RECALL

During power up, or after any low-power condition ($V_{CC} < 3.0V$), an internal RECALL request will be latched. When V_{CC} once again exceeds 4.25V, a RECALL cycle will automatically be initiated and will take $t_{RESTORE}$ to complete.

If the FTN16C8 is in a WRITE state at the end of power-up *RECALL*, the SRAM data will be corrupted. To help avoid this situation, a 10K Ohm resistor should be connected either between \overline{W} and system V_{CC} or between \overline{E} and system V_{CC} .

HARDWARE PROTECT

The FTN16C8 offers two levels of protection to suppress inadvertent *STORE* cycles. If the control signals (\overline{E} , \overline{G} , \overline{W} and \overline{NE}) remain in the *STORE* condition at the end of a *STORE* cycle, a second *STORE* cycle will not be started. The *STORE* (or *RECALL*) will be initiated only after a transition on any one of these signals to the required state. In addition to multi-trigger protection, *STOREs* are inhibited when V_{CC} is below 4.0V, protecting against inadvertent *STOREs*.

LOW AVERAGE ACTIVE POWER

The FTN16C8 draws significantly less current when it is cycled at times longer than 55ns. Figure 2 shows the relationship between I_{CC} and READ cycle time. Worst-case current consumption is shown for both CMOS and TTL input levels (commercial temperature range, $V_{CC} = 5.5V$, 100% duty cycle on chip enable). Figure 3 shows the same relationship for WRITE cycles. If the chip enable duty cycle is less than 100%, only standby current is drawn when the chip is disabled. The overall average current drawn by the FTN16C8 depends on the following items: 1) CMOS vs. TTL input levels; 2) the duty cycle of chip enable; 3) the overall cycle rate for accesses; 4) the ratio of READs to WRITEs; 5) the operating temperature; 6) the V_{CC} level; and 7) I/O loading.
