FUNCTIONAL BLOCK DIAGRAM

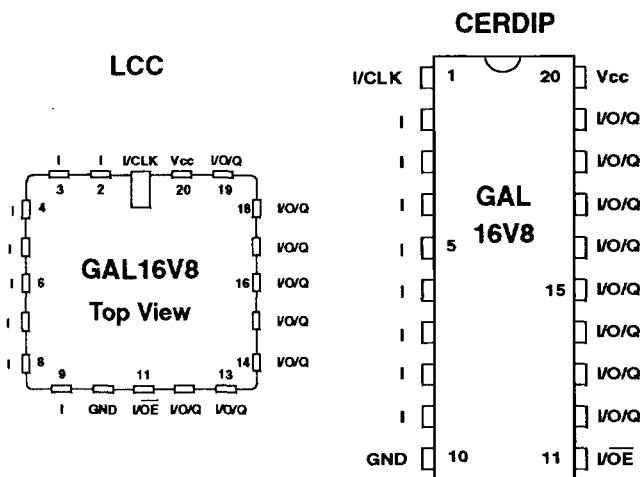

DESCRIPTION

The GAL16V8/883 is a high performance E²CMOS programmable logic device processed in full compliance to MIL-STD-883. This military grade device combines a high performance CMOS process with Electrically Erasable (E²) floating gate technology to provide the highest speed/power performance available in the 883 qualified PLD market. The GAL16V8C/883, at 7.5ns maximum propagation delay time, is the world's fastest military qualified CMOS PLD.

The generic GAL architecture provides maximum design flexibility by allowing the Output Logic Macrocell (OLMC) to be configured by the user. The GAL16V8/883 is capable of emulating all standard 20-pin PAL® devices with full function/fuse map/parametric compatibility.

Unique test circuitry and reprogrammable cells allow complete AC, DC, and functional testing during manufacture. Therefore, Lattice guarantees 100% fieldprogrammability and functionality of all GAL products. Lattice also guarantees 100 erase/rewrite cycles and that data retention exceeds 20 years.

f_{max} DESCRIPTIONS

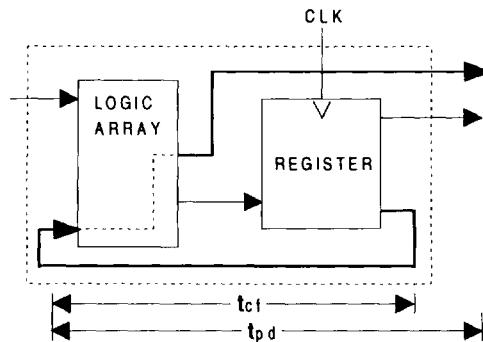

f_{max} with External Feedback $1/(tsu+tco)$

Note: f_{max} with external feedback is calculated from measured tsu and tco.

f_{max} with No Feedback

Note: f_{max} with no feedback may be less than $1/(twh + twl)$. This is to allow for a clock duty cycle of other than 50%.

f_{max} with Internal Feedback $1/(tsu+tcf)$

Note: tcf is a calculated value, derived by subtracting tsu from the period of f_{max} w/internal feedback ($tcf = 1/f_{max} - tsu$). The value of tcf is used primarily when calculating the delay from clocking a register to a combinatorial output (through registered feedback), as shown above. For example, the timing from clock to a combinatorial output is equal to tcf + tpd.
