

Low voltage 32K×8 CMOS SRAM

Features

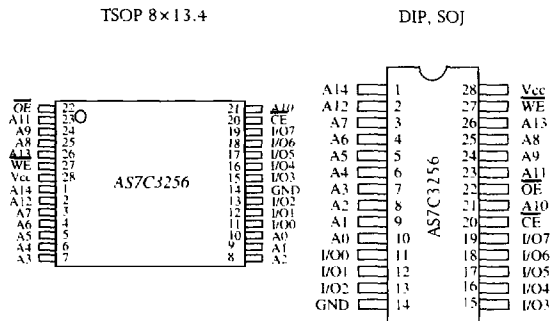

- Organization: 32,768 words × 8 bits
- Single 3.3 ± 0.3V power supply
- 5V tolerant I/O specification
- High speed
  - 10/12/15/20 ns address access time
  - 3/3/4/5 ns output enable access time
- Very low power consumption
  - Active: 216 mW max, 10 ns cycle
  - Standby: 3.6 mW max, CMOS I/O  
1.1 mW max, CMOS I/O, L version
- 2.0V data retention
- Equal access and cycle times
- Easy memory expansion with  $\overline{CE}$  and  $\overline{OE}$  inputs
- TTL-compatible, three-state I/O
- Ideal for cache, modem, portable computing
  - 75% power reduction during CPU idle mode
- 28-pin JEDEC standard packages
  - 300 mil PDIP and SOJ
  - 8 × 13.4 TSOP
- ESD protection ≥ 2000 volts
- Latch-up current ≥ 200 mA

### Functional description

The AS7C3256 is a 3.3V high performance CMOS 262,144-bit Static Random-Access Memory (SRAM) organized as 32,768 words × 8 bits. It is designed for memory applications requiring fast data access at low voltage, including Pentium™, PowerPC™, and portable computing. Alliance's advanced circuit design and process techniques permit 3.3V operation without sacrificing performance or operating margins.

The device enters standby mode when  $\overline{CE}$  is HIGH. CMOS standby mode consumes  $\leq 3.6$  mW ( $\leq 1.1$  mW for the L version). Normal operation offers 75% power reduction after initial access, resulting in significant power savings during CPU idle, suspend, and stretch mode. Both versions of the AS7C3256 offer 2.0V data retention.

Equal address access and cycle times ( $t_{AA}$ ,  $t_{RC}$ ,  $t_{WC}$ ) of 10/12/15/20 ns with output enable access times ( $t_{OE}$ ) of 3/3/4/5 ns are ideal for high performance applications. The chip enable ( $\overline{CE}$ ) input permits easy memory expansion with multiple-bank memory organizations.

A write cycle is accomplished by asserting chip enable ( $\overline{CE}$ ) and write enable ( $\overline{WE}$ ) LOW. Data on the input pins I/O0-I/O7 is written on the rising edge of  $\overline{WE}$  (write cycle 1) or  $\overline{CE}$  (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ( $\overline{OE}$ ) or write enable ( $\overline{WE}$ ).

A read cycle is accomplished by asserting chip enable ( $\overline{CE}$ ) and output enable ( $\overline{OE}$ ) LOW, with write enable ( $\overline{WE}$ ) HIGH. The chip drives I/O pins with the data word referenced by the input address. When chip enable or output enable is HIGH, or write enable is LOW, output drivers stay in high-impedance mode.

All chip inputs and outputs are TTL-compatible and 5V tolerant. Operation is from a single 3.3±0.3V supply. The AS7C3256 is packaged in high volume industry standard packages.

### Absolute maximum ratings

Parameter	Symbol	Min	Max	Unit
Power supply voltage relative to GND	$V_{CC}$	-0.5	+4.6	V
Input voltage relative to GND	$V_{IN}$	-0.5	+6.0	V
Power dissipation	$P_D$	-	1.0	W
Storage temperature (plastic)	$T_{stg}$	-55	+150	°C
Temperature under bias	$T_{bias}$	-10	+85	°C
DC output current	$I_{out}$	-	20	mA

Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### Notes

- 1 During V<sub>CC</sub> power-up, a pull-up resistor to V<sub>CC</sub> on  $\overline{CE}$  is required to meet I<sub>SB</sub> specification.
- 2 This parameter is sampled and not 100% tested.
- 3 For test conditions, see AC Test Conditions, Figures A, B, C.
- 4 t<sub>CLZ</sub> and t<sub>CHZ</sub> are specified with CL = 5pF as in Figure C. Transition is measured ±500mV from steady-state voltage.
- 5 This parameter is guaranteed but not tested.
- 6  $\overline{WE}$  is HIGH for read cycle.
- 7  $\overline{CE}$  and  $\overline{OE}$  are LOW for read cycle.
- 8 Address valid prior to or coincident with  $\overline{CE}$  transition LOW.
- 9 All read cycle timings are referenced from the last valid address to the first transitioning address.
- 10  $\overline{CE}$  or  $\overline{WE}$  must be HIGH during address transitions.
- 11 All write cycle timings are referenced from the last valid address to the first transitioning address.
