74LVT16245A • 74LVTH16245 Low Voltage 16-Bit Transceiver with 3-STATE Outputs

General Description

The LVT16245A and LVTH16245 contain sixteen non-inverting bidirectional buffers with 3-STATE outputs and is intended for bus oriented applications. The device is byte controlled. Each byte has separate control inputs which can be shorted together for full 16-bit operation. The T/\overline{R} inputs determine the direction of data flow through the device. The \overline{OE} inputs disable both the A and B ports by placing them in a high impedance state.

The LVTH16245 data inputs include bushold, eliminating the need for external pull-up resistors to hold unused inputs.

These non-inverting transceivers are designed for low-voltage (3.3V) V_{CC} applications, but with the capability to provide a TTL interface to a 5V environment. The LVT16245A and LVTH16245 are fabricated with an advanced BiCMOS

technology to achieve high speed operation similar to 5V ABT while maintaining low power dissipation.

Features

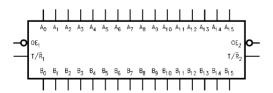

- \blacksquare Input and output interface capability to systems at 5V V_{CC}
- Bus-Hold data inputs eliminate the need for external pull-up resistors to hold unused inputs (74LVTH16245), also available without bushold feature (74LVT16245A).
- Live insertion/extraction permitted
- Power Up/Down high impedance provides glitch-free bus loading
- Outputs source/sink –32 mA/+64 mA
- Functionally compatible with the 74 series 16245
- Latch-up performance exceeds 500 mA

Functional Description

The LVT16245A and LVTH16245 contain sixteen non-inverting bidirectional buffers with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of the other. The control pins can be shorted together to obtain full 16-bit operation.

Note 3: All typical values are at $V_{CC} = 3.3V$, $T_A = 25^{\circ}C$.

Note 4: Applies to Bushold versions only (74LVTH16245).

Note 5: An external driver must source at least the specified current to switch from LOW to HIGH.

Note 6: An external driver must sink at least the specified current to switch from HIGH to LOW.

Note 7: This is the increase in supply current for each input that is at the specified voltage level rather than V_{CC} or GND.
