DESCRIPTION

The 'FCT377 has eight edge-triggered, D-type flip-flops with individual D inputs and O outputs. The common buffered clock (CP) input loads all flip-flops simultaneously when the Clock Enable (CE) is LOW. The register is fully edge-triggered. The state of each D input one set-

up time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's O output. The CE input must be stable only one set-up time prior to the LOW-to-HIGH clock transition for predictable operation.

Notes:

- Typical limits are at $V_{CC} = 5.0\text{V}$, $T_A = +25^\circ\text{C}$ ambient.
- Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect

operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

- This parameter is guaranteed but not tested.
