Description

The H5TC2G83FFR-xxA(I,L,J) and H5TC2G63FFR-xxA(I,L,J) are a 2Gb low power Double Data Rate III (DDR3L) Synchronous DRAM, ideally suited for the main memory applications which requires large memory density, high bandwidth and low power operation at 1.35V. SK Hynix DDR3L SDRAM provides backward compatibility with the 1.5V DDR3 based environment without any changes. SK Hynix 2Gb DDR3L SDRAMs offer fully synchronous operations referenced to both rising and falling edges of the clock. While all addresses and control inputs are latched on the rising edges of the clock (falling edges of the clock), data, data strobes and write data masks inputs are sampled on both rising and falling edges of it. The data paths are internally pipelined and 8-bit prefetched to achieve very high bandwidth.

Device Features and Ordering Information

FEATURES

- VDD=VDDQ=1.35V + 0.100 / - 0.067V
- Fully differential clock inputs (CK, $\overline{CK}$) operation
- Differential Data Strobe (DQS, $\overline{DQS}$)
- On chip DLL align DQ, DQS and $\overline{DQS}$ transition with CK transition
- DM masks write data-in at the both rising and falling edges of the data strobe
- All addresses and control inputs except data, data strobes and data masks latched on the rising edges of the clock
- Programmable CAS latency 6, 7, 8, 9, 10, 11, 12 and 13 supported
- Programmable additive latency 0, CL-1, and CL-2 supported
- Programmable CAS Write latency (CWL) = 5, 6, 7, 8
- Programmable burst length 4/8 with both nibble sequential and interleave mode
- BL switch on the fly
- 8banks
- Average Refresh Cycle (Tcase of 0 ^{o}C~95 ^{o}C)
  - 7.8 µs at 0^{o}C ~ 85 ^{o}C
  - 3.9 µs at 85^{o}C ~ 95 ^{o}C
  Commerical Temperature (0^{o}C ~ 95 ^{o}C)
  Industrial Temperature(-40^{o}C ~ 95 ^{o}C)
- JEDEC standard 78ball FBGA(x8), 96ball FBGA(x16)
- Driver strength selected by EMRS
- Dynamic On Die Termination supported
- Asynchronous RESET pin supported
- ZQ calibration supported
- TDQS (Termination Data Strobe) supported (x8 only)
- Write Levelization supported
- 8 bit pre-fetch

*** This product in compliance with the RoHS directive.**

Pin Functional Description

Symbol	Type	Function
CK, $\overline{CK}$	Input	Clock: CK and $\overline{CK}$ are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of $\overline{CK}$.
CKE, (CKE0), (CKE1)	Input	Clock Enable: CKE HIGH activates, and CKE Low deactivates, internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self-Refresh operation (all banks idle), or Active Power-Down (row Active in any bank). CKE is asynchronous for Self-Refresh exit. After VREFCA and VREFDQ have become stable during the power on and initialization sequence, they must be maintained during all operations (including Self-Refresh). CKE must be maintained high throughout read and write accesses. Input buffers, excluding CK, $\overline{CK}$, ODT and CKE, are disabled during power-down. Input buffers, excluding CKE, are disabled during Self-Refresh.
$\overline{CS}$, ($\overline{CS0}$), ($\overline{CS1}$), ($\overline{CS2}$), ($\overline{CS3}$)	Input	Chip Select: All commands are masked when $\overline{CS}$ is registered HIGH. $\overline{CS}$ provides for external Rank selection on systems with multiple Ranks. $\overline{CS}$ is considered part of the command code.
ODT, (ODT0), (ODT1)	Input	On Die Termination: ODT (registered HIGH) enables termination resistance internal to the DDR3L SDRAM. When enabled, ODT is only applied to each DQ, DQS, $\overline{DQS}$ and DM/TDQS, NU/$\overline{TDQS}$ (When TDQS is enabled via Mode Register A11=1 in MR1) signal for x4/x8 configurations. For x16 configuration, ODT is applied to each DQ, DQSU, $\overline{DQSU}$, DQSL, $\overline{DQSL}$, DMU, and DML signal. The ODT pin will be ignored if MR1 is programmed to disable ODT.
$\overline{RAS}$. $\overline{CAS}$. $\overline{WE}$	Input	Command Inputs: $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$ (along with $\overline{CS}$) define the command being entered.
DM, (DMU), (DML)	Input	Input Data Mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS. For x8 device, the function of DM or TDQS/$\overline{TDQS}$ is enabled by Mode Register A11 setting in MR1.
BA0 - BA2	Input	Bank Address Inputs: BA0 - BA2 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines if the mode register or extended mode register is to be accessed during a MRS cycle.
A0 - A15	Input	Address Inputs: Provide the row address for Active commands and the column address for Read/Write commands to select one location out of the memory array in the respective bank. (A10/AP and A12/$\overline{BC}$ have additional functions, see below). The address inputs also provide the op-code during Mode Register Set commands.
A10 / AP	Input	Auto-precharge: A10 is sampled during Read/Write commands to determine whether Autoprecharge should be performed to the accessed bank after the Read/Write operation. (HIGH: Autoprecharge; LOW: no Autoprecharge).A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by bank addresses.
A12 / $\overline{BC}$	Input	Burst Chop: A12 / $\overline{BC}$ is sampled during Read and Write commands to determine if burst chop (on-the-fly) will be performed. (HIGH, no burst chop; LOW: burst chopped). See command truth table for details.

Symbol	Type	Function
$\overline{RESET}$	Input	Active Low Asynchronous Reset: Reset is active when $\overline{RESET}$ is LOW, and inactive when $\overline{RESET}$ is HIGH. $\overline{RESET}$ must be HIGH during normal operation. $\overline{RESET}$ is a CMOS rail-to-rail signal with DC high and low at 80% and 20% of V_{DD}, i.e. 1.20V for DC high and 0.30V for DC low.
DQ	Input / Output	Data Input/ Output: Bi-directional data bus.
DQU, DQL, DQS, $\overline{DQS}$, DQSU, $\overline{DQSU}$, DQSL, $\overline{DQSL}$	Input / Output	Data Strobe: output with read data, input with write data. Edge-aligned with read data, centered in write data. The data strobe DQS, DQSL, and DQSU are paired with differential signals $\overline{DQS}$, $\overline{DQSL}$, and $\overline{DQSU}$, respectively, to provide differential pair signaling to the system during reads and writes. DDR3L SDRAM supports differential data strobe only and does not support single-ended.
TDQS, $\overline{TDQS}$	Output	Termination Data Strobe: TDQS/$\overline{TDQS}$ is applicable for x8 DRAMs only. When enabled via Mode Register A11 = 1 in MR1, the DRAM will enable the same termination resistance function on TDQS/$\overline{TDQS}$ that is applied to DQS/$\overline{DQS}$. When disabled via mode register A11 = 0 in MR1, DM/TDQS will provide the data mask function and $\overline{TDQS}$ is not used. x4 DRAMs must disable the TDQS function via mode register A11 = 0 in MR1.
NC		No Connect: No internal electrical connection is present.
NF		No Function
V_{DDQ}	Supply	DQ Power Supply: 1.35 V +0.100/-0.067V
V_{SSQ}	Supply	DQ Ground
V_{DD}	Supply	Power Supply: 1.35 V +0.100/-0.067V
V_{SS}	Supply	Ground
V_{REFDQ}	Supply	Reference voltage for DQ
V_{REFCA}	Supply	Reference voltage for CA
ZQ	Supply	Reference Pin for ZQ calibration

Note:
Input only pins (BA0-BA2, A0-A15, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{CS}$, CKE, ODT, DM, and $\overline{RESET}$) do not supply termination.

ROW AND COLUMN ADDRESS TABLE

2Gb

Configuration	256Mb x 8	128Mb x 16
# of Banks	8	8
Bank Address	BA0 - BA2	BA0 - BA2
Auto precharge	A10/AP	A10/AP
BL switch on the fly	A12/$\overline{BC}$	A12/$\overline{BC}$
Row Address	A0 - A14	A0 - A13
Column Address	A0 - A9	A0 - A9
Page size [1]	1 KB	2 KB

Note1: Page size is the number of bytes of data delivered from the array to the internal sense amplifiers when an ACTIVE command is registered. Page size is per bank, calculated as follows:

page size $= 2^{COLBITS} * ORG \div 8$

where COLBITS = the number of column address bits, ORG = the number of I/O (DQ) bits

Absolute Maximum Ratings

Absolute Maximum DC Ratings

Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
VDD	Voltage on VDD pin relative to Vss	- 0.4 V ~ 1.80 V	V	1,3
VDDQ	Voltage on VDDQ pin relative to Vss	- 0.4 V ~ 1.80 V	V	1,3
V_{IN}, V_{OUT}	Voltage on any pin relative to Vss	- 0.4 V ~ 1.80 V	V	1
T_{STG}	Storage Temperature	-55 to +100	^{o}C	1, 2

Notes:

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
3. VDD and VDDQ must be within 300mV of each other at all times; and VREF must not be greater than 0.6XVDDQ,When VDD and VDDQ are less than 500mV; VREF may be equal to or less than 300mV.

DRAM Component Operating Temperature Range

Temperature Range

Symbol	Parameter	Rating	Units	Notes
T_{OPER}	Normal Operating Temperature Range	0 to 85	^{o}C	1,2
	Extended Temperature Range	85 to 95	^{o}C	1,4
	Industrial Temperature Range	-40 to 95	^{o}C	1,3,4

Notes:

1. Operating Temperature TOPER is the case surface temperature on the center / top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 - 85oC under all operating conditions.
3. The Industrial Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between -40 - 85oC under all operating conditions.
4. Some applications require operation of the DRAM in the Extended Temperature Range between 85oC and 95oC case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
   a. Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9 µs.
   b. If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b).

AC & DC Operating Conditions

Recommended DC Operating Conditions

Recommended DC Operating Conditions - DDR3L (1.35V) operation

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
VDD	Supply Voltage	1.283	1.35	1.45	V	1,2,3,4
VDDQ	Supply Voltage for Output	1.283	1.35	1.45	V	1,2,3,4

Notes:

1. Maximum DC value may not be greater than 1.425V. The DC value is the linear average of VDD/VDDQ (t) over a very long period of time (e.g., 1 sec).
2. If maximum limit is exceeded, input levels shall be governed by DDR3 specifications.
3. Under these supply voltages, the device operates to this DDR3L specification.
4. Once initialized for DDR3L operation, DDR3 operation may only be used if the device is in reset while VDD and VDDQ are changed for DDR3 operation (see Figure 0).

Recommended DC Operating Conditions - DDR3 (1.5V) operation

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
VDD	Supply Voltage	1.425	1.5	1.575	V	1,2,3
VDDQ	Supply Voltage for Output	1.425	1.5	1.575	V	1,2,3

Notes:

1. If minimum limit is exceeded, input levels shall be governed by DDR3L specifications.
2. Under 1.5V operation, this DDR3L device operates to the DDR3 specifications under the same speed timings as defined for this device.
3. Once initialized for DDR3 operation, DDR3L operation may only be used if the device is in reset while VDD and VDDQ are changed for DDR3L operation (see Figure 0).

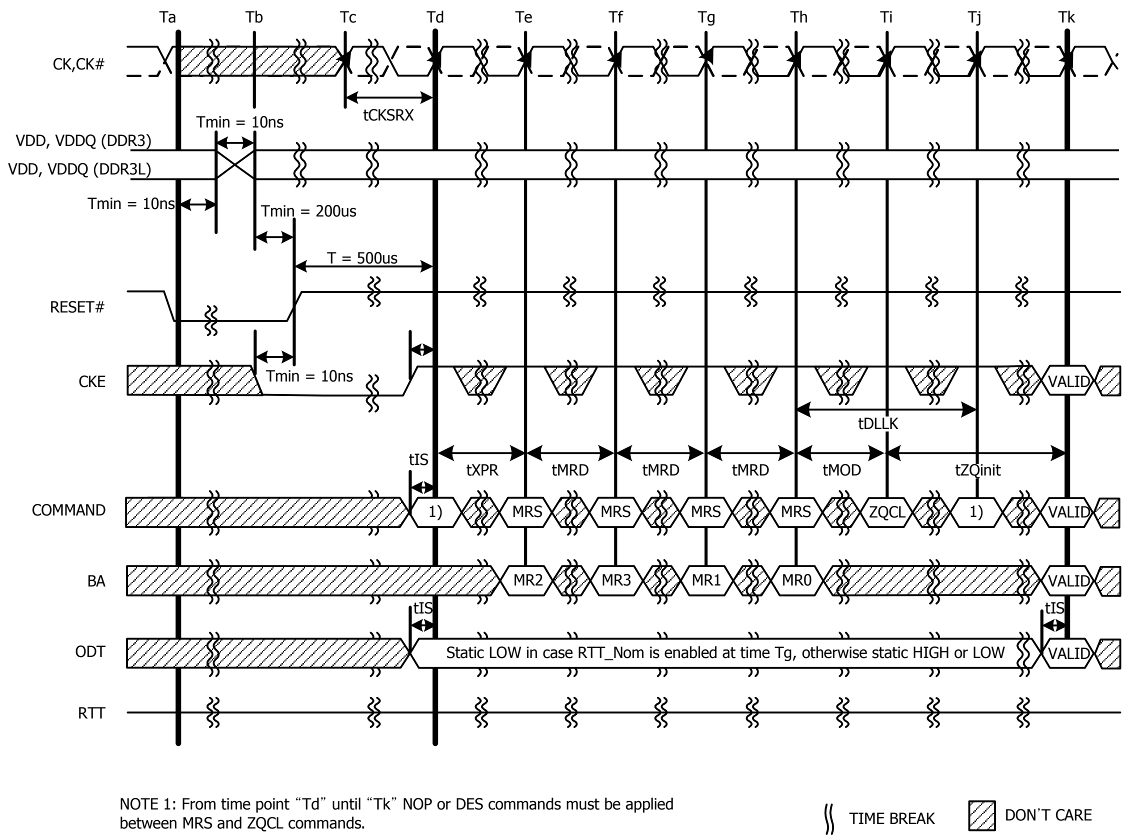

Figure 0 - VDD/VDDQ Voltage Switch Between DDR3L and DDR3L

IDD and IDDQ Specification Parameters and Test Conditions

IDD and IDDQ Measurement Conditions

In this chapter, IDD and IDDQ measurement conditions such as test load and patterns are defined. Figure 1. shows the setup and test load for IDD and IDDQ measurements.

- IDD currents (such as IDD0, IDD1, IDD2N, IDD2NT, IDD2P0, IDD2P1, IDD2Q, IDD3N, IDD3P, IDD4R, IDD4W, IDD5B, IDD6, IDD6ET and IDD7) are measured as time-averaged currents with all VDD balls of the DDR3L SDRAM under test tied together. Any IDDQ current is not included in IDD currents.
- IDDQ currents (such as IDDQ2NT and IDDQ4R) are measured as time-averaged currents with all VDDQ balls of the DDR3L SDRAM under test tied together. Any IDD current is not included in IDDQ currents.
  Attention: IDDQ values cannot be directly used to calculate IO power of the DDR3L SDRAM. They can be used to support correlation of simulated IO power to actual IO power as outlined in Figure 2. In DRAM module application, IDDQ cannot be measured separately since VDD and VDDQ are using one merged-power layer in Module PCB.

For IDD and IDDQ measurements, the following definitions apply:

- "0" and "LOW" is defined as VIN <= $V_{ILAC(max)}$.
- "1" and "HIGH" is defined as VIN >= $V_{IHAC(max)}$.
- "MID_LEVEL" is defined as inputs are VREF = VDD/2.
- Timing used for IDD and IDDQ Measurement-Loop Patterns are provided in Table 1.
- Basic IDD and IDDQ Measurement Conditions are described in Table 2.
- Detailed IDD and IDDQ Measurement-Loop Patterns are described in Table 3 through Table 10.
- IDD Measurements are done after properly initializing the DDR3L SDRAM. This includes but is not limited to setting
  RON = RZQ/7 (34 Ohm in MR1);
  Qoff = 0_B (Output Buffer enabled in MR1);
  RTT_Nom = RZQ/6 (40 Ohm in MR1);
  RTT_Wr = RZQ/2 (120 Ohm in MR2);
  TDQS Feature disabled in MR1
- Attention: The IDD and IDDQ Measurement-Loop Patterns need to be executed at least one time before actual IDD or IDDQ measurement is started.
- Define D = {$\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$}:= {HIGH, LOW, LOW, LOW}
- Define $\overline{D}$ = {$\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$}:= {HIGH, HIGH, HIGH, HIGH}

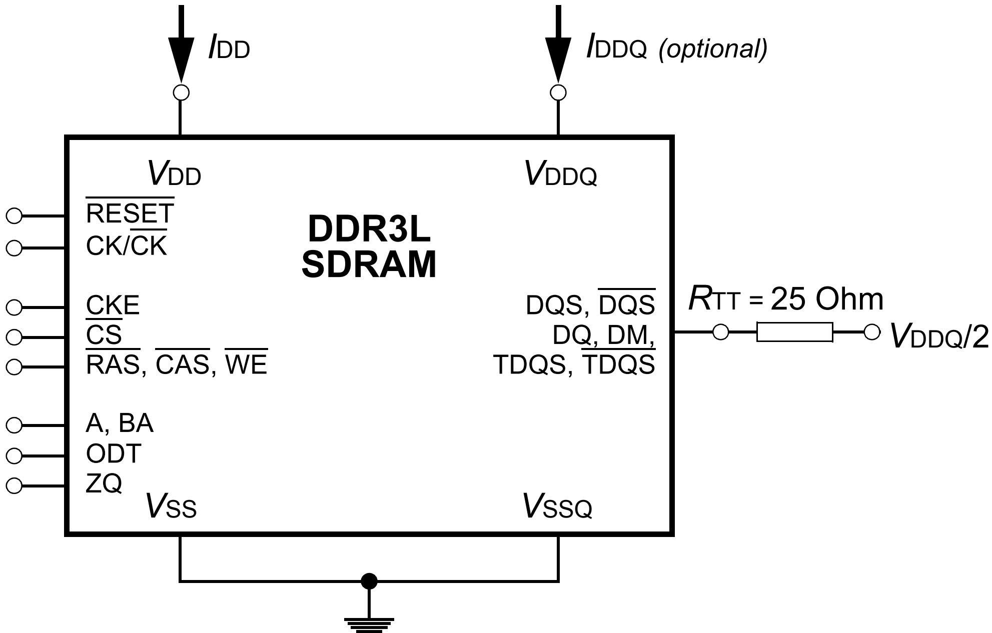

Figure 1 - Measurement Setup and Test Load for IDD and IDDQ (optional) Measurements
[Note: DIMM level Output test load condition may be different from above]

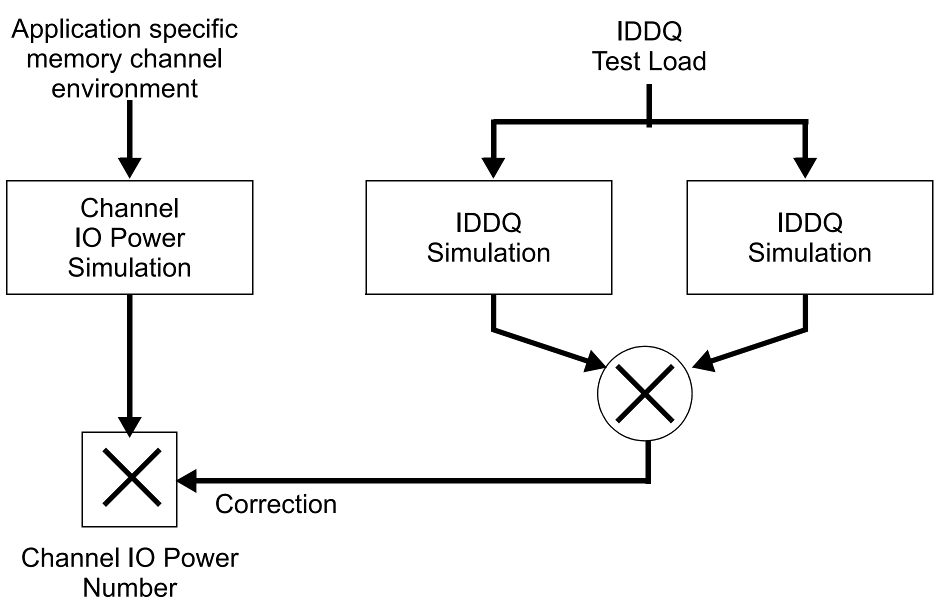

Figure 2 - Correlation from simulated Channel IO Power to actual Channel IO Power supported by IDDQ Measurement

I_{DD4R}	Operating Burst Read Current CKE: High; External clock: On; tCK, CL: see Table 1; BL: 8[a)]; AL: 0; $\overline{CS}$: High between RD; Command, Address, Bank Address Inputs: partially toggling according to Table 7; Data IO: seamless read data burst with different data between one burst and the next one according to Table 7; DM: stable at 0; Bank Activity: all banks open, RD commands cycling through banks: 0,0,1,1,2,2,...(see Table 7); Output Buffer and RTT: Enabled in Mode Registers[b)]; ODT Signal: stable at 0; Pattern Details: see Table 7.
I_{DD4W}	Operating Burst Write Current CKE: High; External clock: On; tCK, CL: see Table 1; BL: 8[a)]; AL: 0; $\overline{CS}$: High between WR; Command, Address, Bank Address Inputs: partially toggling according to Table 8; Data IO: seamless read data burst with different data between one burst and the next one according to Table 8; DM: stable at 0; Bank Activity: all banks open, WR commands cycling through banks: 0,0,1,1,2,2,...(see Table 8); Output Buffer and RTT: Enabled in Mode Registers[b)]; ODT Signal: stable at HIGH; Pattern Details: see Table 8.
I_{DD5B}	Burst Refresh Current CKE: High; External clock: On; tCK, CL, nRFC: see Table 1; BL: 8[a)]; AL: 0; $\overline{CS}$: High between REF; Command, Address, Bank Address Inputs: partially toggling according to Table 9; Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: REF command every nREF (see Table 9); Output Buffer and RTT: Enabled in Mode Registers[b)]; ODT Signal: stable at 0; Pattern Details: see Table 9.
I_{DD6}	Self-Refresh Current: Normal Temperature Range T_{CASE}: 0 - 85 ^{o}C; Auto Self-Refresh (ASR): Disabled[d)];Self-Refresh Temperature Range (SRT): Normal[e)]; CKE: Low; External clock: Off; CK and $\overline{CK}$: LOW; CL: see Table 1; BL: 8[a)]; AL: 0; $\overline{CS}$, Command, Address, Bank Address Inputs, Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: Self-Refresh operation; Output Buffer and RTT: Enabled in Mode Registers[b)]; ODT Signal: MID_LEVEL

Symbol	Description
I_{DD6ET}	Self-Refresh Current: Extended Temperature Range T_{CASE}: 0 - 95 ^{o}C; Auto Self-Refresh (ASR): Disabled[d];Self-Refresh Temperature Range (SRT): Extended[e]; CKE: Low; External clock: Off; CK and $\overline{CK}$: LOW; CL: see Table 1; BL: 8[a]; AL: 0; $\overline{CS}$, Command, Address, Bank Address Inputs, Data IO: MID_LEVEL; DM: stable at 0; Bank Activity: Extended Temperature Self-Refresh operation; Output Buffer and RTT: Enabled in Mode Registers[b]; ODT Signal: MID_LEVEL
I_{DD7}	Operating Bank Interleave Read Current CKE: High; External clock: On; tCK, nRC, nRAS, nRCD, NRRD, nFAW, CL: see Table 1; BL: 8[a], [f]; AL: CL-1; $\overline{CS}$: High between ACT and RDA; Command, Address, Bank Address Inputs: partially toggling according to Table 10; Data IO: read data burst with different data between one burst and the next one according to Table 10; DM: stable at 0; Bank Activity: two times interleaved cycling through banks (0, 1,...7) with different addressing, wee Table 10; Output Buffer and RTT: Enabled in Mode Registers[b]; ODT Signal: stable at 0; Pattern Details: see Table 10.

a) Burst Length: BL8 fixed by MRS: set MR0 A[1,0]=00B

b) Output Buffer Enable: set MR1 A[12] = 0B; set MR1 A[5,1] = 01B; RTT_Nom enable: set MR1 A[9,6,2] = 011B; RTT_Wr enable: set MR2 A[10,9] = 10B

c) Precharge Power Down Mode: set MR0 A12=0B for Slow Exit or MR0 A12 = 1B for Fast Exit

d) Auto Self-Refresh (ASR): set MR2 A6 = 0B to disable or 1B to enable feature

e) Self-Refresh Temperature Range (SRT): set MR2 A7 = 0B for normal or 1B for extended temperature range

f) Read Burst Type: Nibble Sequential, set MR0 A[3] = 0B

Parameter	Symbol	DDR3L-1066		DDR3L-1333		DDR3L-1600		DDR3L-1866		Units	Notes
		Min	Max	Min	Max	Min	Max	Min	Max		
Input/output capacitance (DQ, DM, DQS, $\overline{DQS}$, TDQS, $\overline{TDQS}$)	C_{IO}	1.4	2.7	1.4	2.5	1.4	2.3	1.4	2.2	pF	1,2,3
Input capacitance, CK and $\overline{CK}$	C_{CK}	0.8	1.6	0.8	1.4	0.8	1.4	0.8	1.3	pF	2,3
Input capacitance delta CK and $\overline{CK}$	C_{DCK}	0	0.15	0	0.15	0	0.15	0	0.15	pF	2,3,4
Input capacitance delta, DQS and $\overline{DQS}$	C_{DDQS}	0	0.20	0	0.15	0	0.15	0	0.15	pF	2,3,5
Input capacitance (All other input-only pins)	C_I	0.75	1.35	0.75	1.3	0.75	1.3	0.75	1.2	pF	2,3,6
Input capacitance delta (All CTRL input-only pins)	C_{DI_CTRL}	-0.5	0.3	-0.4	0.2	-0.4	0.2	-0.4	0.2	pF	2,3,7,8
Input capacitance delta (All ADD/CMD input-only pins)	$C_{DI\_ADD\_CMD}$	-0.5	0.5	-0.4	0.4	-0.4	0.4	-0.4	0.4	pF	2,3,9,10
Input/output capacitance delta (DQ, DM, DQS, $\overline{DQS}$)	C_{DIO}	-0.5	0.3	-0.5	0.3	-0.5	0.3	-0.5	0.3	pF	2,3,11
Input/output capacitance of ZQ pin	C_{ZQ}	-	3	-	3	-	3	-	3	pF	2,3,12

Notes:

1. Although the DM, TDQS and $\overline{TDQS}$ pins have different functions, the loading matches DQ and DQS.
2. This parameter is not subject to production test. It is verified by design and characterization. The capacitance is measured according to JEP147("PROCEDURE FOR MEASURING INPUT CAPACITANCE USING A VECTOR NETWORK ANALYZER(VNA)") with VDD, VDDQ, VSS,VSSQ applied and all other pins floating (except the pin under test, CKE, $\overline{RESET}$ and ODT as necessary). VDD=VDDQ=1.5V, VBIAS=VDD/2 and on-die termination off.
3. This parameter applies to monolithic devices only; stacked/dual-die devices are not covered here
4. Absolute value of C_{CK}-$C_{\overline{CK}}$.
5. Absolute value of C_{IO}(DQS)-C_{IO}($\overline{DQS}$).
6. C_I applies to ODT, $\overline{CS}$, CKE, A0-A15, BA0-BA2, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$.
7. C_{DI_CTR} applies to ODT, $\overline{CS}$ and CKE.
8. C_{DI_CTRL}=C_I(CNTL) - 0.5 * C_I(CLK) + C_I($\overline{CLK}$))
9. $C_{DI\_ADD\_CMD}$ applies to A0-A15, BA0-BA2, $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$.
10. $C_{DI\_ADD\_CMD}$=C_I(ADD_CMD) - 0.5*(C_I(CLK)+C_I($\overline{CLK}$))
11. C_{DIO}=C_{IO}(DQ) - 0.5*(C_{IO}(DQS)+C_{IO}($\overline{DQS}$))
12. Maximum external load capacitance an ZQ pin: 5 pF.

Standard Speed Bins

DDR3L SDRAM Standard Speed Bins include tCK, tRCD, tRP, tRAS and tRC for each corresponding bin.

DDR3L-1066 Speed Bins

For specific Notes see "Speed Bin Table Notes" on page 31.

Speed Bin			DDR3L-1066		Unit	Note
CL - nRCD - nRP			7-7-7			
Parameter		Symbol	min	max		
Internal read command to first data		t_{AA}	13.125	20	ns	
ACT to internal read or write delay time		t_{RCD}	13.125	—	ns

Supported CL Settings			6, 8, 10, 13, (7), (9), (11)		n_{CK}	
Supported CWL Settings			5, 6, 7, 8, 9		n_{CK}	

Speed Bin Table Notes

Absolute Specification (T_{OPER}; V_{DDQ} = V_{DD} = 1.5V +/- 0.075 V);

1. The CL setting and CWL setting result in tCK(AVG).MIN and tCK(AVG).MAX requirements. When making a selection of tCK(AVG), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2. tCK(AVG).MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(AVG) value (3.0, 2.5, 1.875, 1.5, or 1.25 ns) when calculating CL [nCK] = tAA [ns] / tCK(AVG) [ns], rounding up to the next 'Supported CL', where tCK(AVG) = 3.0 ns should only be used for CL = 5 calculation.
3. tCK(AVG).MAX limits: Calculate tCK(AVG) = tAA.MAX / CL SELECTED and round the resulting tCK(AVG) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is tCK(AVG).MAX corresponding to CL SELECTED.
4. 'Reserved' settings are not allowed. User must program a different value.
5. 'Optional' settings allow certain devices in the industry to support this setting, however, it is not a mandatory feature. Refer to SK Hynix DIMM data sheet and/or the DIMM SPD information if and how this setting is supported.
6. Any DDR3L-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
7. Any DDR3L-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
8. Any DDR3L-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
9. Any DDR3L-1866 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
10. Any DDR3L-2133 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
11. SK Hynix DDR3L SDRAM devices supporting optional down binning to CL=7 and CL=9, and tAA/tRCD/tRP must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3L-1333H devices supporting down binning to DDR3L-1066F should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3L-1600K devices supporting down binning to DDR3L-1333H or DDR3L-1600F should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21,23) also should be programmed accordingly. For example, 49.125ns (tRASmin + tRPmin = 36 ns + 13.125 ns) for DDR3L-1333H and 48.125ns (tRASmin + tRPmin = 35 ns + 13.125 ns) for DDR3L-1600K.
12. DDR3L 800 AC timing apply if DRAM operates at lower than 800 MT/s data rate.
13. For CL5 support, refer to DIMM SPD information. DRAM is required to support CL5. CL5 is not mandatory in SPD coding.
14. SK Hynix DDR3L SDRAM devices supporting optional down binning to CL=11, CL=9 and CL=7, tAA/tRCD/tRPmin must be 13.125ns. SPD setting must be programed to match. For example, DDR3L-1866M devices supporting down binning to DDR3L-1600K or DDR3L-1333H or 1066F should program 13.125ns in SPD bytes for tAAmin(byte 16), tRCDmin(byte 18) and tRPmin(byte 20) is programmed to 13.125ns, tRCmin(byte 21,23) also should be programmed accordingly. For example, 47.125ns (tRASmin + tRPmin = 34ns +13.125ns)
