

■ FEATURES

- Vcc operation voltage : 2.4V ~ 3.6V
- Very low power consumption :
 - Vcc = 3.0V C-grade : 20mA (Max.) operating current
 - I- grade : 25mA (Max.) operating current
 - 0.02uA (Typ.) CMOS standby current
- High speed access time :
 - 70 70ns (Max.) at Vcc = 3.0V
- Automatic power down when chip is deselected
- Three state outputs and TTL compatible
- Fully static operation
- Data retention supply voltage as low as 1.5V
- Easy expansion with CE2, CE1, and OE options

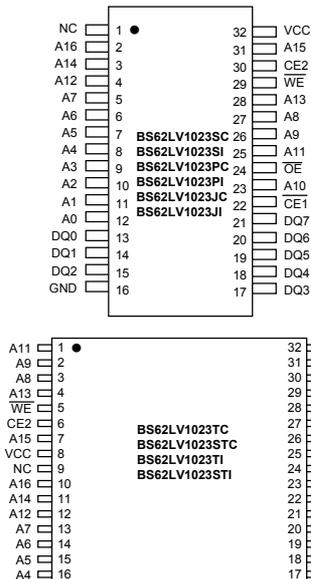

■ DESCRIPTION

The BS62LV1023 is a high performance, very low power CMOS Static Random Access Memory organized as 131,072 words by 8 bits and operates from a wide range of 2.4V to 3.6V supply voltage. Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 0.02uA and maximum access time of 70ns in 3V operation. Easy memory expansion is provided by an active LOW chip enable (CE1), an active HIGH chip enable (CE2), and active LOW output enable (OE) and three-state output drivers. The BS62LV1023 has an automatic power down feature, reducing the power consumption significantly when chip is deselected. The BS62LV1023 is available in DICE form, JEDEC standard 32 pin 450mil Plastic SOP, 300mil Plastic SOJ, 600mil Plastic DIP, 8mmx13.4 mm STSOP and 8mmx20mm TSOP.

■ PIN DESCRIPTIONS

Name	Function
A0-A16 Address Input	These 17 address inputs select one of the 131,072 x 8-bit words in the RAM
$\overline{CE1}$ Chip Enable 1 Input $\overline{CE2}$ Chip Enable 2 Input	$\overline{CE1}$ is active LOW and $\overline{CE2}$ is active HIGH. Both chip enables must be active when data read from or write to the device. If either chip enable is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high impedance state when the device is deselected.
\overline{WE} Write Enable Input	The write enable input is active LOW and controls read and write operations. With the chip selected, when \overline{WE} is HIGH and \overline{OE} is LOW, output data will be present on the DQ pins; when \overline{WE} is LOW, the data present on the DQ pins will be written into the selected memory location.
\overline{OE} Output Enable Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when \overline{OE} is inactive.
DQ0-DQ7 Data Input/Output Ports	These 8 bi-directional ports are used to read data from or write data into the RAM.

WRITE CYCLE1⁽¹⁾

WRITE CYCLE2 (1,6)

NOTES:

1. \overline{WE} must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of $\overline{CE1}$ and CE2 active and \overline{WE} low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. t_{wr} is measured from the earlier of $\overline{CE1}$ or \overline{WE} going high or CE2 going low at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the CE1 low transition or the CE2 high transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transition, output remain in a high impedance state.
6. \overline{OE} is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If CE1 is low and CE2 is high during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured $\pm 500\text{mV}$ from steady state with $C_L = 5\text{pF}$ as shown in Figure 1B. The parameter is guaranteed but not 100% tested.
11. t_{cw} is measured from the later of $\overline{CE1}$ going low or CE2 going high to the end of write.
