(TOP VIEW)

These octal transparent D-type latches feature 3-state outputs designed specifically for driving highly capacitive or relatively low-impedance loads. They are particularly suitable for implementing buffer registers, I/O ports, bidirectional bus drivers, and working registers.

While the latch-enable (LE) input is high, the Q outputs follow the data (D) inputs. When LE is taken low, the Q outputs are latched at the logic levels set up at the D inputs.

A buffered output-enable ($\overline{OE}$) input can be used to place the eight outputs in either a normal logic state (high or low) or a high-impedance state. In the high-impedance state, the outputs neither load nor drive the bus lines significantly. The high-impedance state and the increased drive provide the capability to drive bus lines without interface or pullup components.

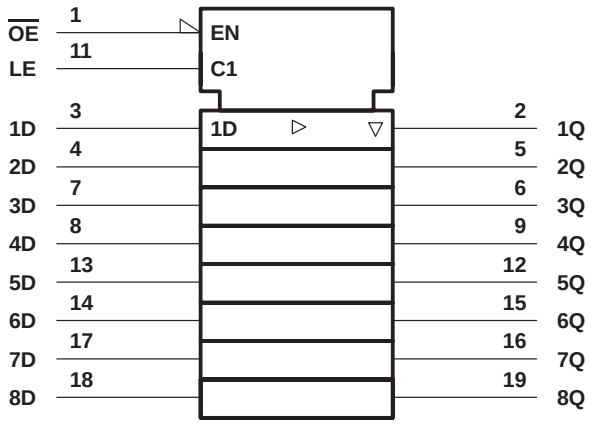
$\overline{OE}$ does not affect internal operations of the latches. Old data can be retained or new data can be entered while the outputs are off.

The SN54ALS373 and SN54AS373 are characterized for operation over the full military temperature range of –55°C to 125°C. The SN74ALS373A and SN74AS373 are characterized for operation from 0°C to 70°C.

FUNCTION TABLE
(each latch)

INPUTS			OUTPUT
$\overline{OE}$	LE	D	Q
L	H	H	H
L	H	L	L
L	L	X	Q_0
H	X	X	Z

logic symbol†



† This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12.

Texas Instruments offers a full spectrum of logic functions and technologies from the mature to the advanced, including bipolar, BiCMOS, and CMOS. TI's process technologies offer the logic performance and features required for modern logic designs, while maintaining support for more traditional logic products. TI's offerings include products in the following process technologies or device families:

- AC, ACT, AHC, AHCT, ALVC, AVC, FCT, HC, HCT, LV, LVC, TVC
- ABT, ABTE, ALB, ALVT, BCT, HSTL, LVT, SSTL, SSTV
- BTA, CBT, CBTLV, FB, FIFO, GTL, GTLP, JTAG, PCA
- ALS, AS, F, LS, S, TTL

TI offers specialized, advanced logic products that improve overall system performance and address design issues, including testability, low skew requirements, bus termination, memory drivers, and low-impedance drivers.

TI offers a wide variety of packaging options, including advanced surface-mount packaging in fine-pitch small-outline and ball-grid-array (BGA) packages. The newest package for logic is the MicroStar Junior™ very-thin, fine-pitch BGA. MicroStar Junior complements the MicroStar BGA™ package to deliver high performance and allows the designer to double input/output density in the same circuit-board area or reduce board area by one-half, compared to standard packaging technology.

For further information on TI logic families, refer to the list of current TI logic technical documentation provided in this preface. For an overview of TI logic, see Section 1. Section 2, *Focus on the History of Logic*, commemorates the 10th anniversary of the *Logic Selection Guide*. Sections 3, 4, and 5 contain a functional index, functional cross-reference, and device selection guide, respectively. These sections list the functions offered, package availability, and applicable literature numbers of data sheets. Appendix A includes additional information about packaging and symbolization. Appendix B provides a cross-reference to match other manufacturers' products to those of TI. Data sheets can be downloaded from the internet at http://www.ti.com or ordered through your local sales office or TI authorized distributor. Please see the back cover of this selection guide for additional information.

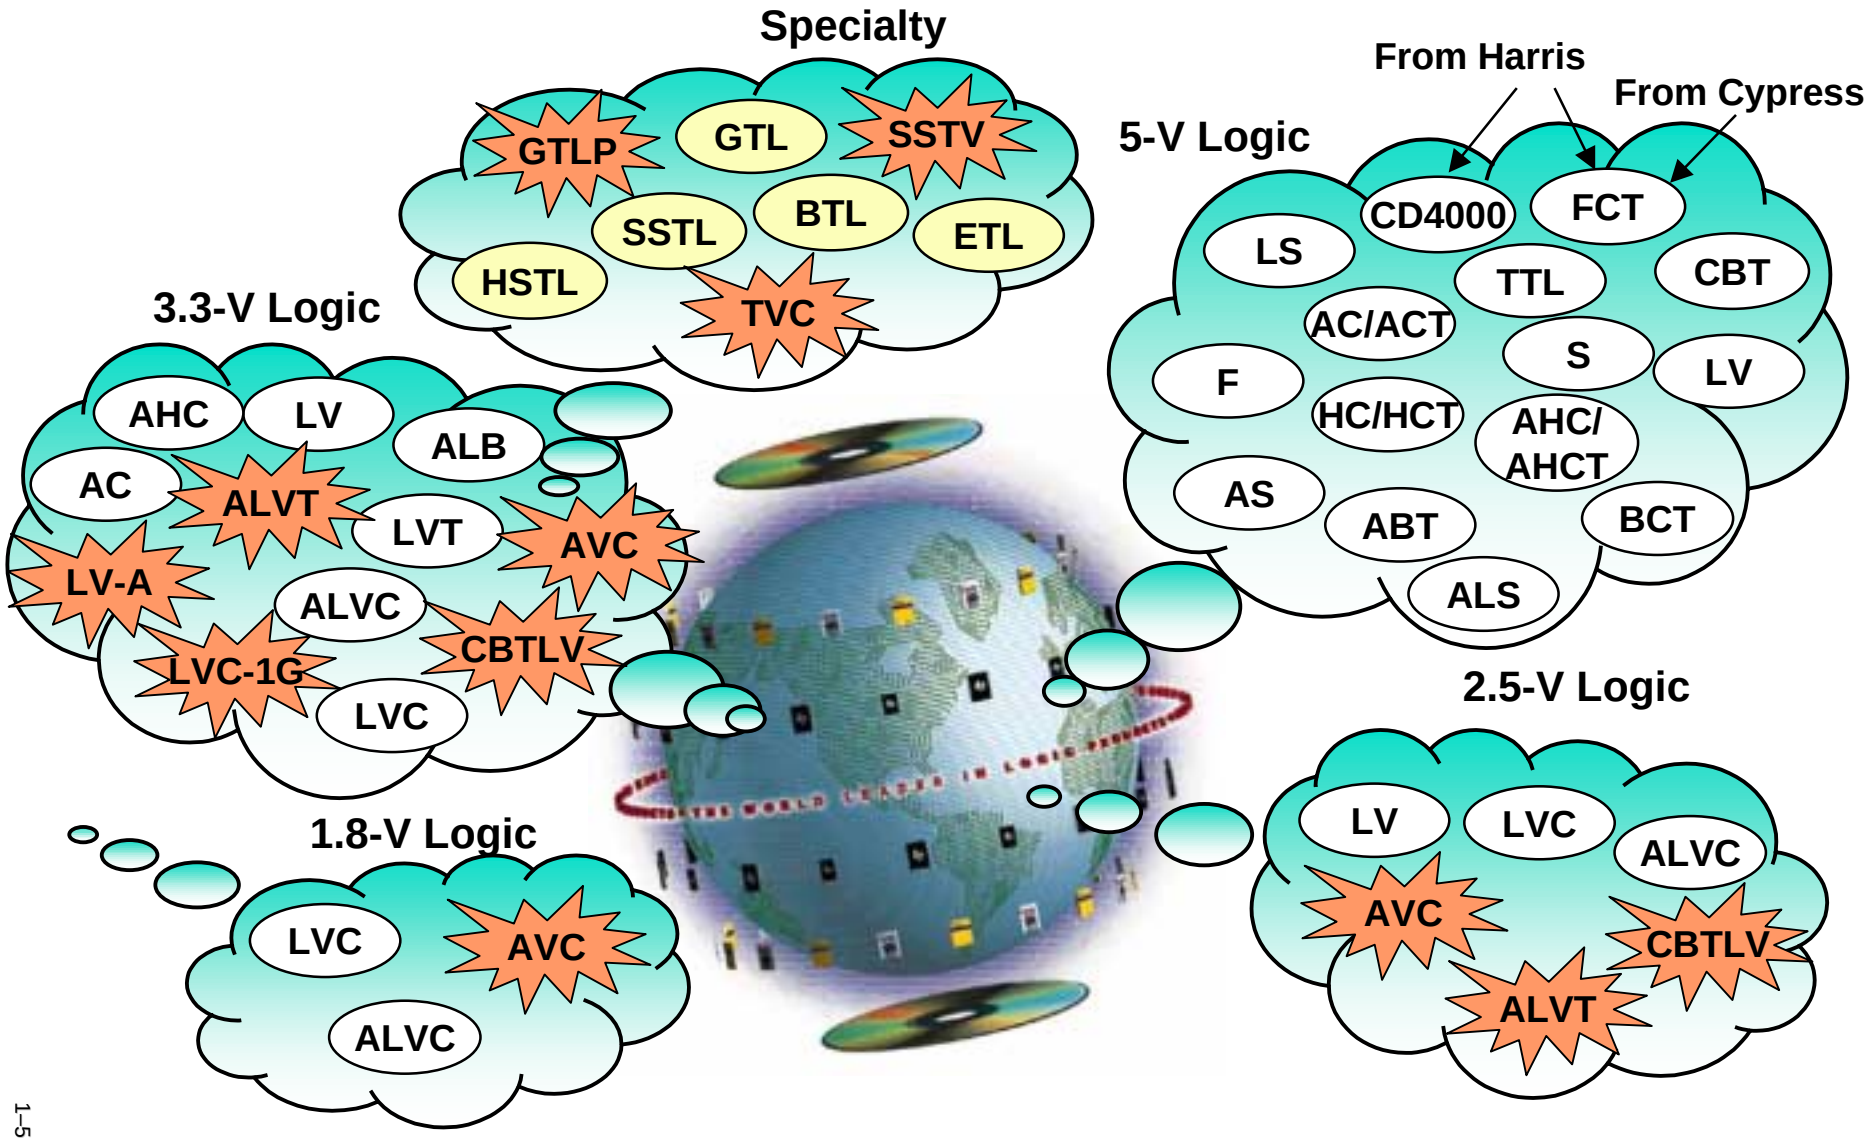
Welcome to the World of TI Logic



Selecting a Logic Family...

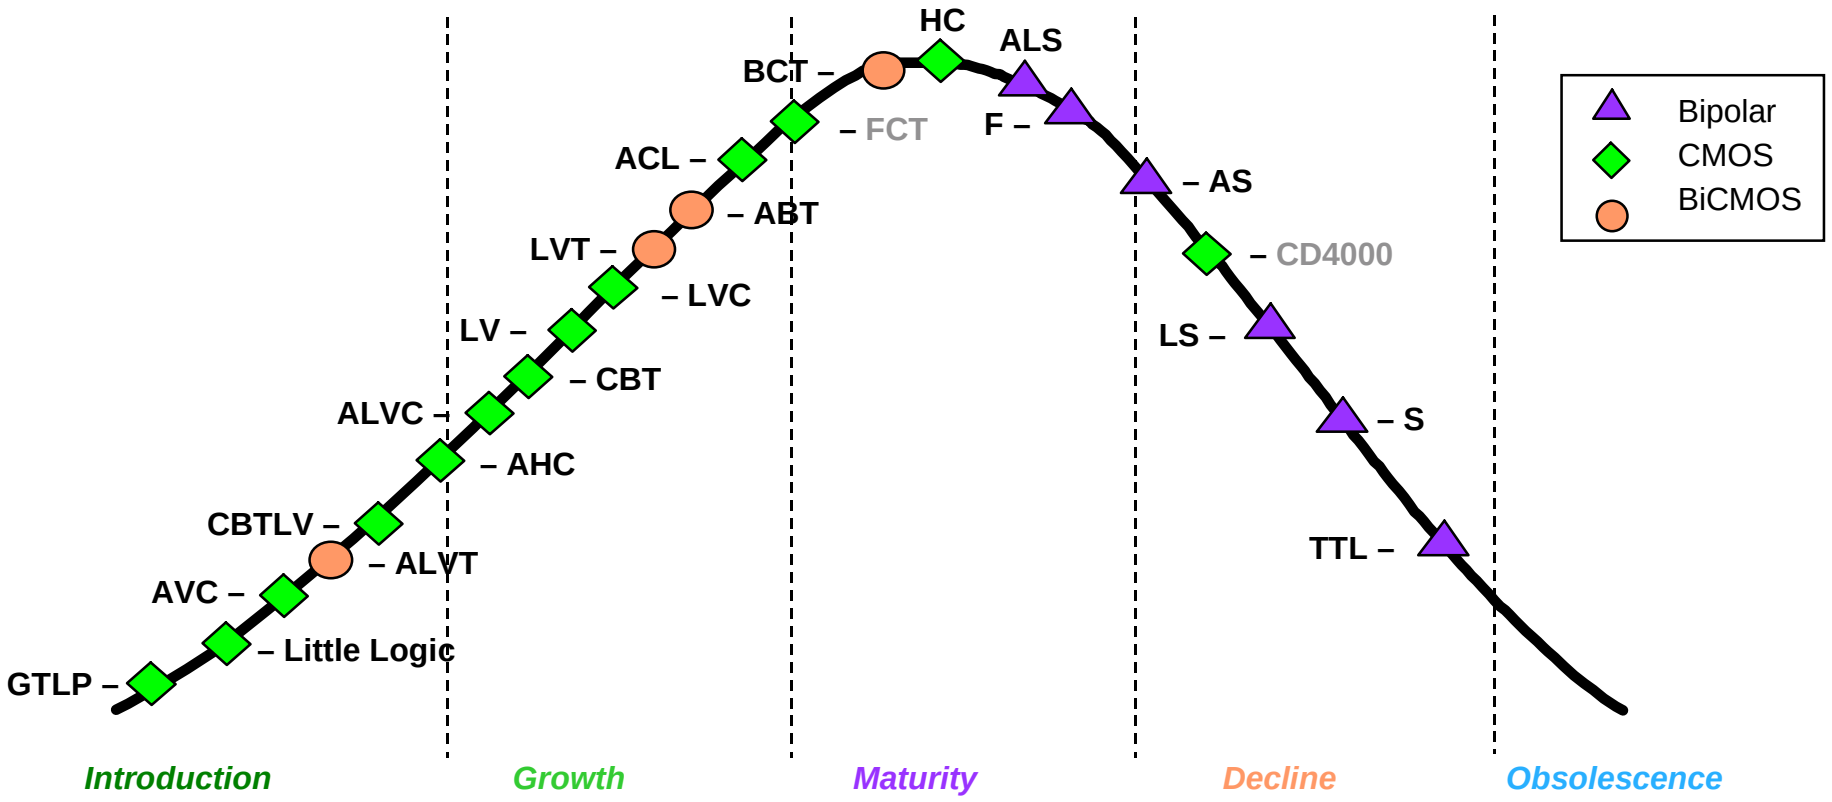
Designer Careabouts...	TI Offers...
	Best Fit First
High Speed	**CBT, CBTLV, AVC, ALB, ALVT, ALVC, ABT, LVT, AHC …**
- Critical Requirements: Slew Rate and Propagation Delay	
High Drive	**ALVT, LVT, ABT, ALB, ALVC, LVC, AVC † …**
- Incident Wave Switching	
Low Power	**CBT, CBTLV, LVC, AHC, ALVC, LV, AVC, ALVT, LVT…**
- Migrate to Lower-Voltage Families	
Ease of Use	**LVC, ALVT, LVT, AHC, AVC, LV, ABT, CBT, CBTLV…**
- Bus Hold, 5-V Tolerance, I_{OFF}, Hot Insertion	

highest interest first

†AVC products with DOC™ increase dynamic drive during switching

DOC is a trademark of Texas Instruments.

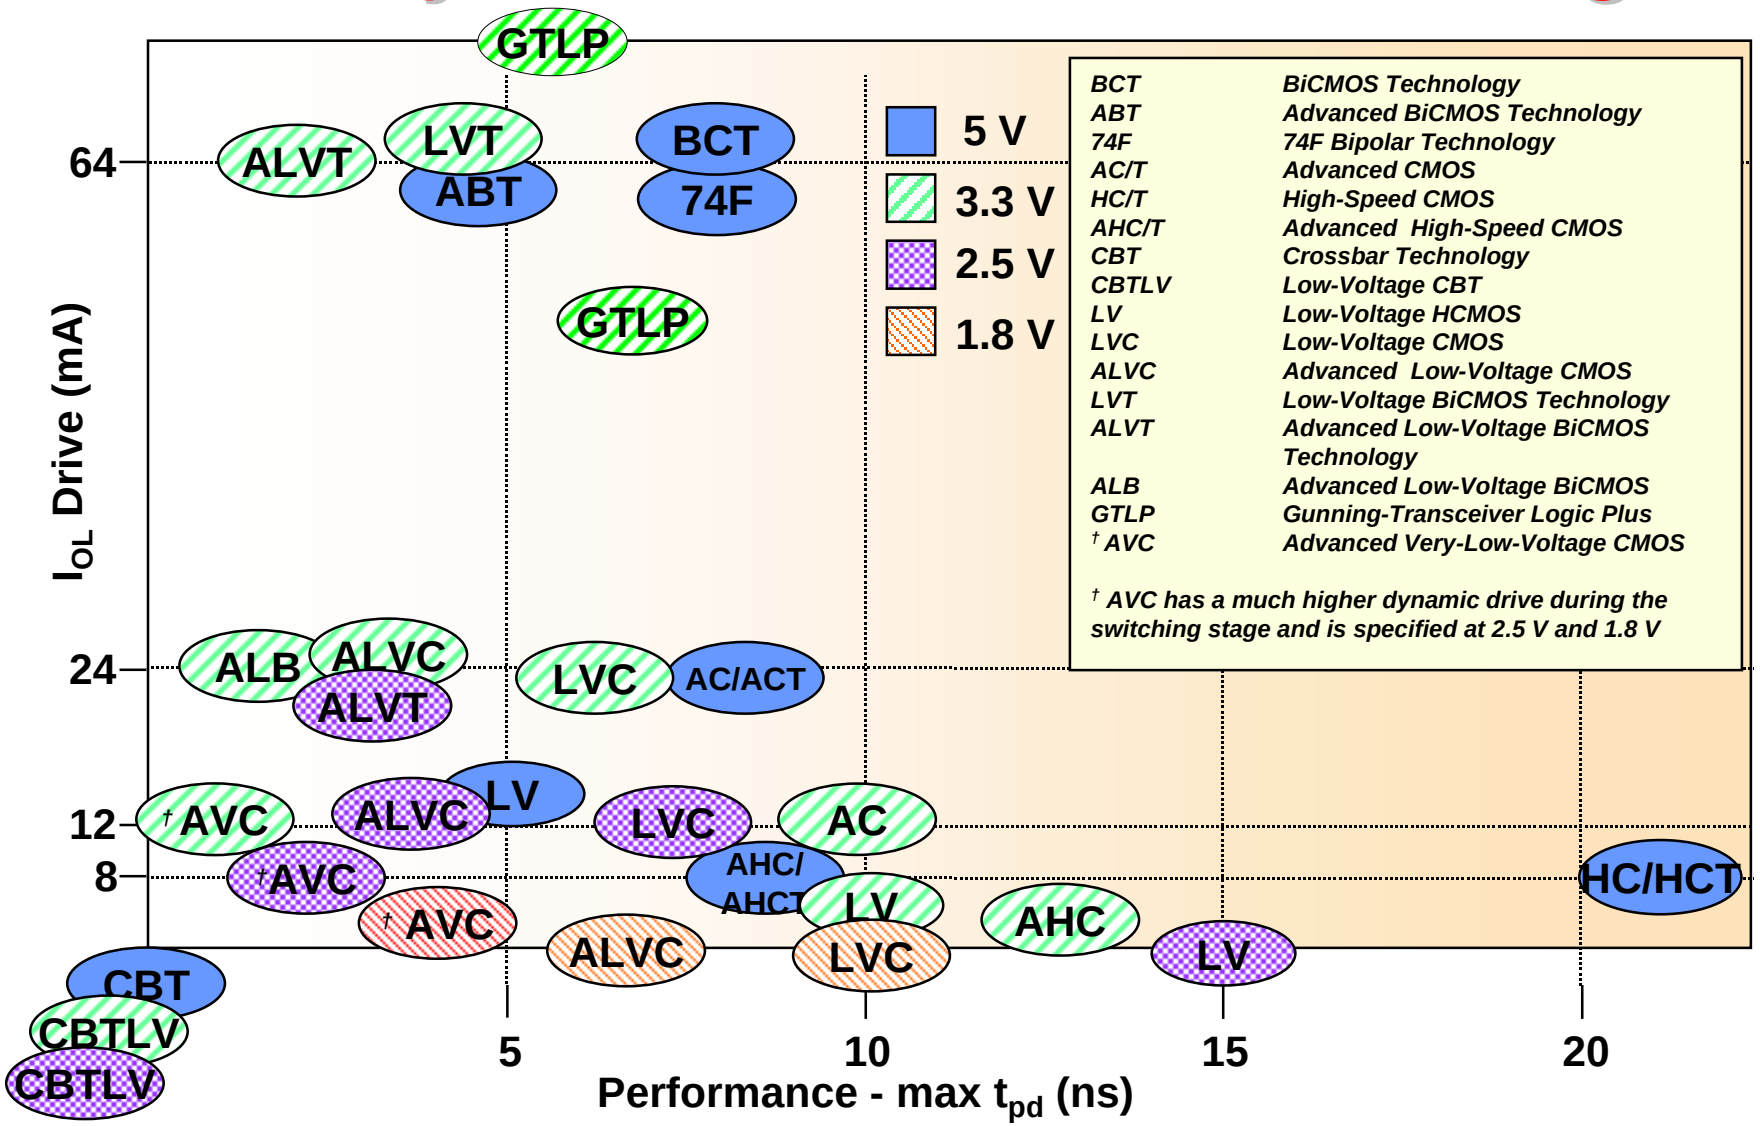
Product Life Cycle



Investment levels for **new products** are at an all-time high.
End-equipment requirements are accelerating new product introduction.

TI remains committed to be the last supplier in the older families.

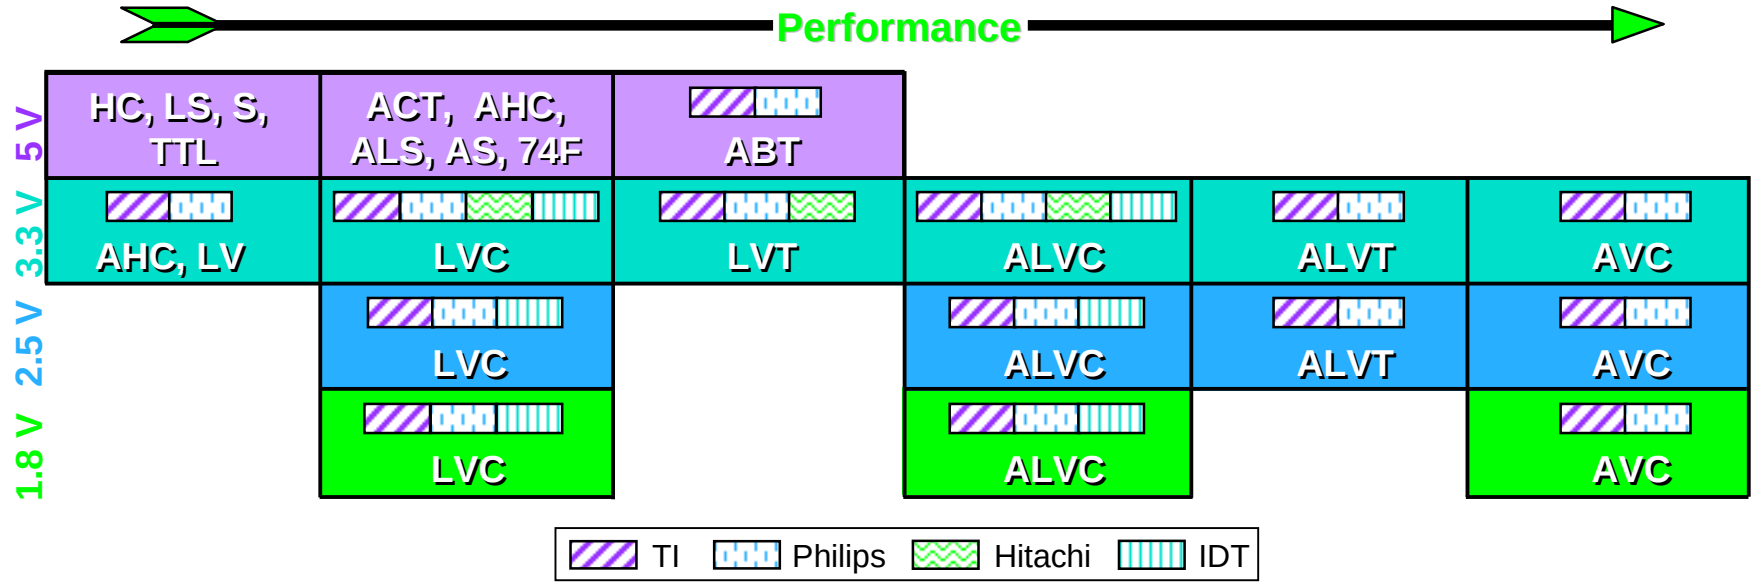
Family Performance Positioning



Logic Vendor Partnerships

Performance Range	TI	Philips	Hitachi	IDT	Toshiba	FSC	On
5-V high performance	ABT	ABT	ABT		ABT	ABT-C	
5-V low performance	AHC	AHC			VHC	VHC	VHC
3-V high performance	ALVT LVT	ALVT LVT	LVT			LVT	
3-V medium performance	ALVC LVC	ALVC LVC	ALVC LVC	ALVC LVC	VCX LCX	VCX LCX	VCX LCX
3-V low performance	LV	LV	LV		LVQ	LVQ LVX	LVQ LVX
2.5-V high performance	AVC	AVC					

Complete Low-Voltage Market Coverage and Standardization



AHC
- ✔8.5-ns speed (5 V)
- ✔13.5-ns speed (3.3 V)
- ✔–8/8-mA drive (5 V)
- ✔–4/4-mA drive (3.3 V)
- ✔5-V or 3.3-V V_{CC}
- ✔5-V input tolerant
- ✔4 WW sources

LVC
- ✔6.5-ns speed
- ✔–24/24-mA drive
- ✔Ultra-low (20 µA) standby power
- ✔3 WW sources
- ✔Bus hold
- ✔5-V tolerant
- ✔Gate functions
- ✔Partial power down

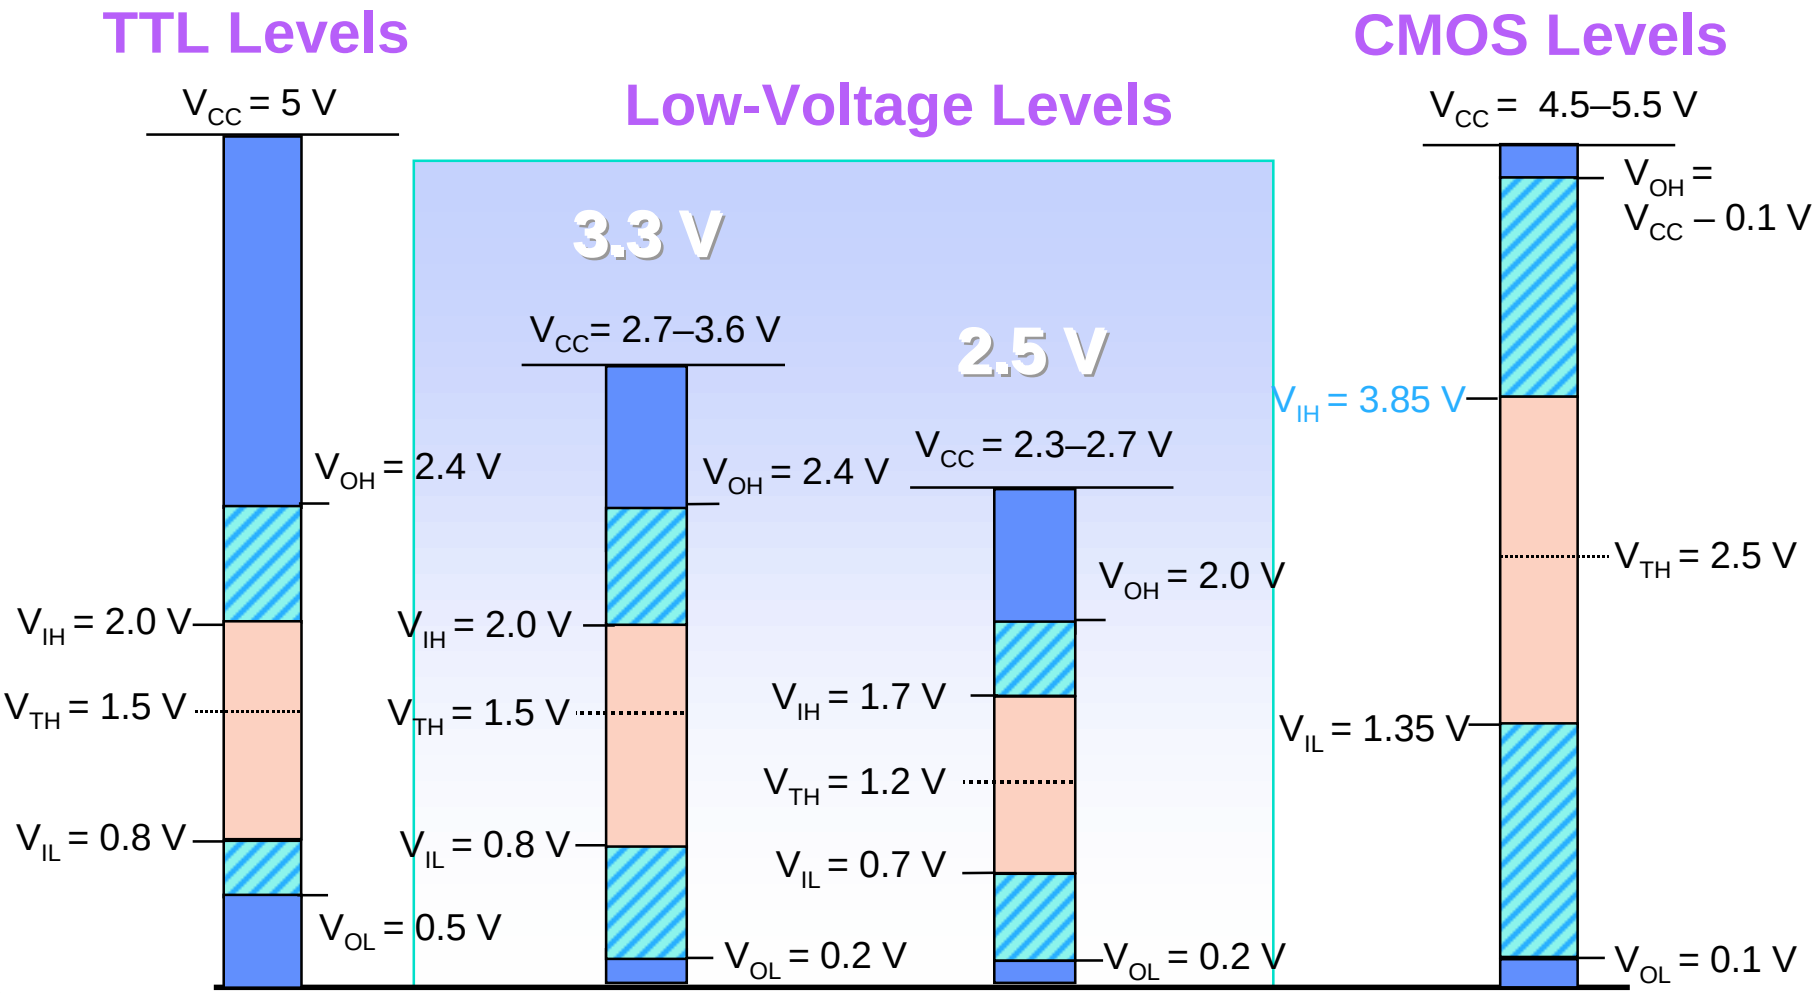
LVT
- ✔4-ns speed
- ✔–32/64-mA drive
- ✔Low (90 µA) standby power
- ✔3 WW sources
- ✔Bus hold
- ✔5-V tolerant
- ✔Hot insertion

ALVC
- ✔3-ns speed
- ✔–24/24-mA drive
- ✔Ultra-low (40 µA) standby power
- ✔3 WW sources
- ✔Bus hold

ALVT
- ✔2.4-ns speed
- ✔–32/64-mA drive
- ✔Low (90 µA) standby power
- ✔2 WW sources
- ✔Bus hold
- ✔5-V tolerant
- ✔Hot insertion
- ✔Auto3-state

AVC
- ✔<2-ns speed
- ✔–12/12-mA drive
- ✔Ultra-low (40 µA) standby power
- ✔2 WW sources
- ✔Bus hold
- ✔3.3-V tolerant
- ✔Partial power down

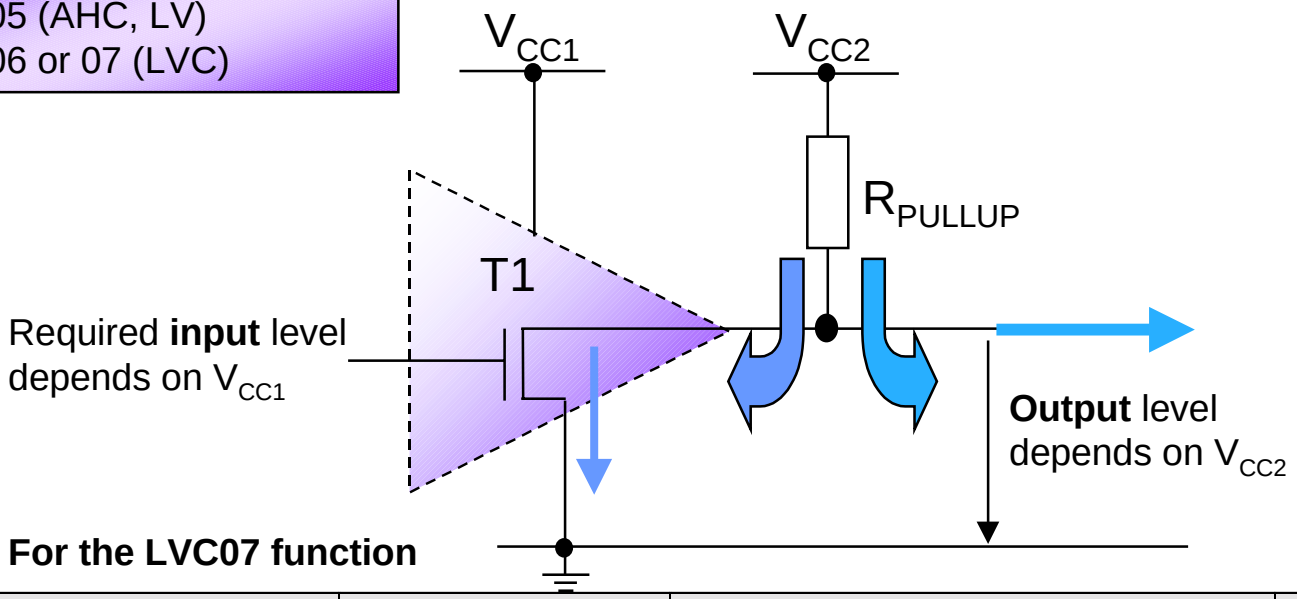
3-V and 5-V TTL and CMOS Specifications



Interfacing Mixed Voltages

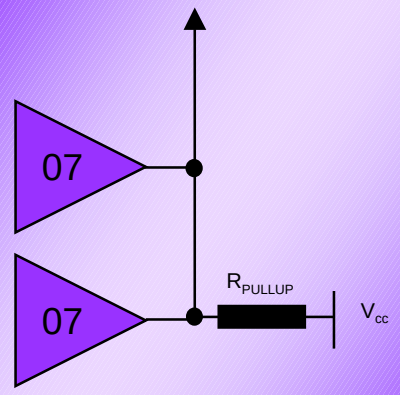
Open-Drain Outputs 05/06/07 Functions

Functions Available
05 (AHC, LV)
06 or 07 (LVC)



For the LVC07 function

Also Possible
Wired-Function Technique

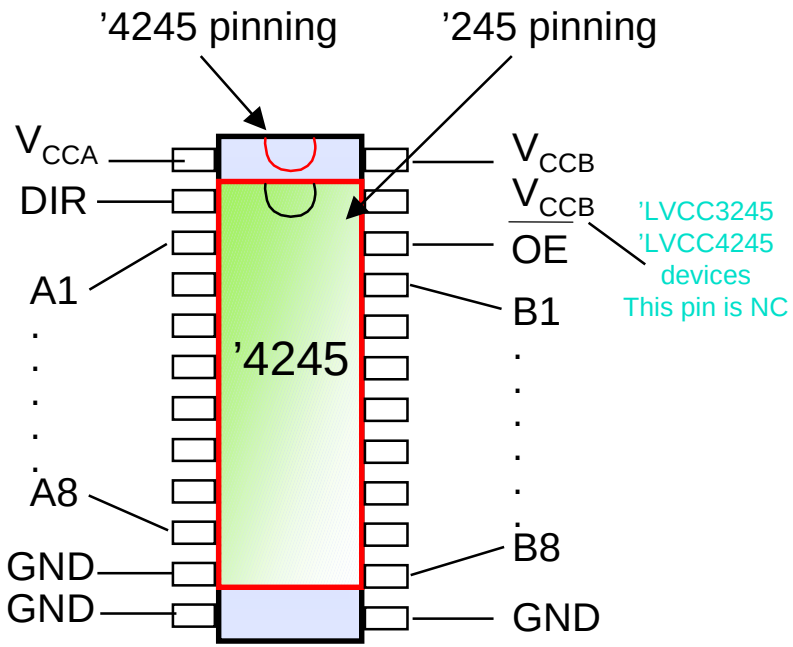


Phantom links on output side can reduce component count.

Supply voltage V_{CC1}	LVC07 understands	Pullup resistor may be connected to	Level conversion range
1.8 V	1.8-V levels	1.8 V, 2.5 V, 3.3 V, and 5 V	1.8 V -> 1.8 V–5.5 V
2.5 V	2.5-V levels	1.8 V, 2.5 V, 3.3 V, and 5 V	2.5 V -> 1.8 V–5.5 V
3.3 V	3.3-V levels	1.8 V, 2.5 V, 3.3 V, and 5 V	3.3 V -> 1.8 V–5.5 V
5 V	5-V levels	1.8 V, 2.5 V, 3.3 V, and 5 V	5 V -> 1.8 V–5.5 V

Special “Dual-Supply” Level Shifters

’LVC4245, ’LVCC3245, ’LVCC4245, and ’ALVC164245



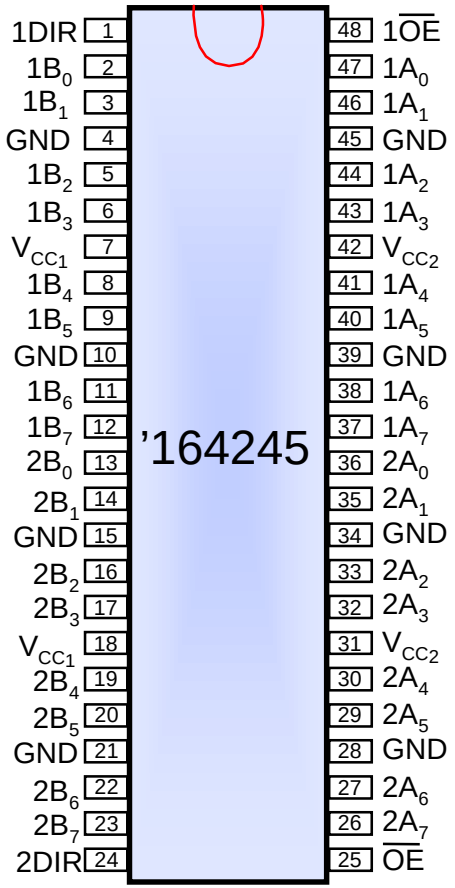
The ’ALVC164245 and ’LVC4245 have 5-V V_{CC} pins and 3.3-V V_{CC} pins.

The ’LVCC3245 and ’LVCC4245 have adjustable output voltages.

The **’LVCC3245** can have one side from 3 V to 5.5 V, while the other side is between 2.3 V and 3.6 V.

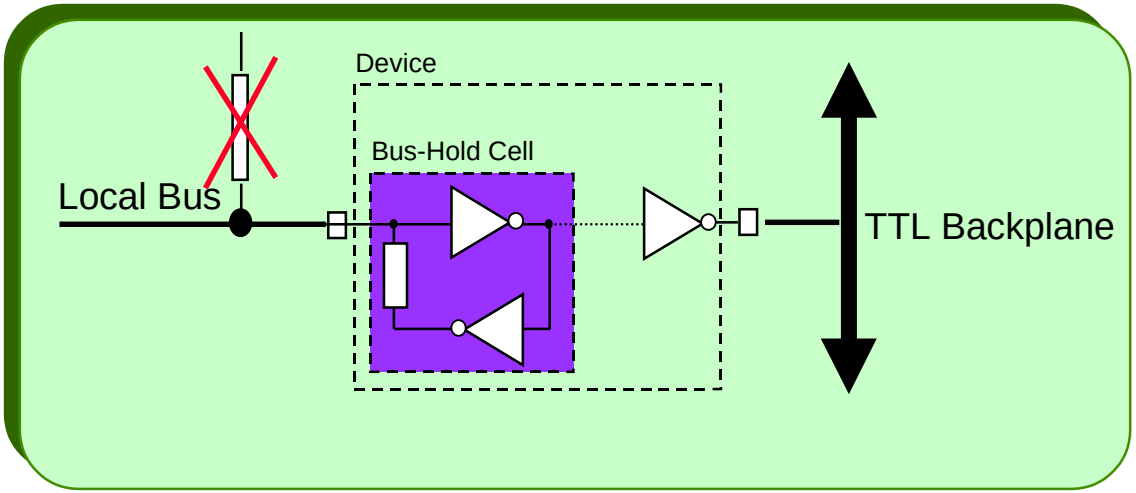
The **’LVCC4245** is fixed at 5 V, while the other side can be connected between 3.3 V and 5 V.

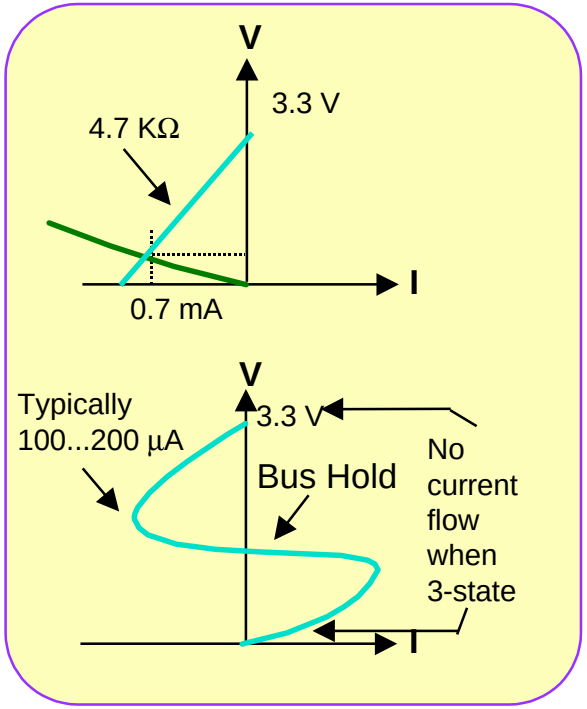
In this way, a full mixed-mode system can be designed.



This solution is compatible with 3.3-V-only systems.
Devices can be replaced later with 3.3-V parts without PCB redesign.

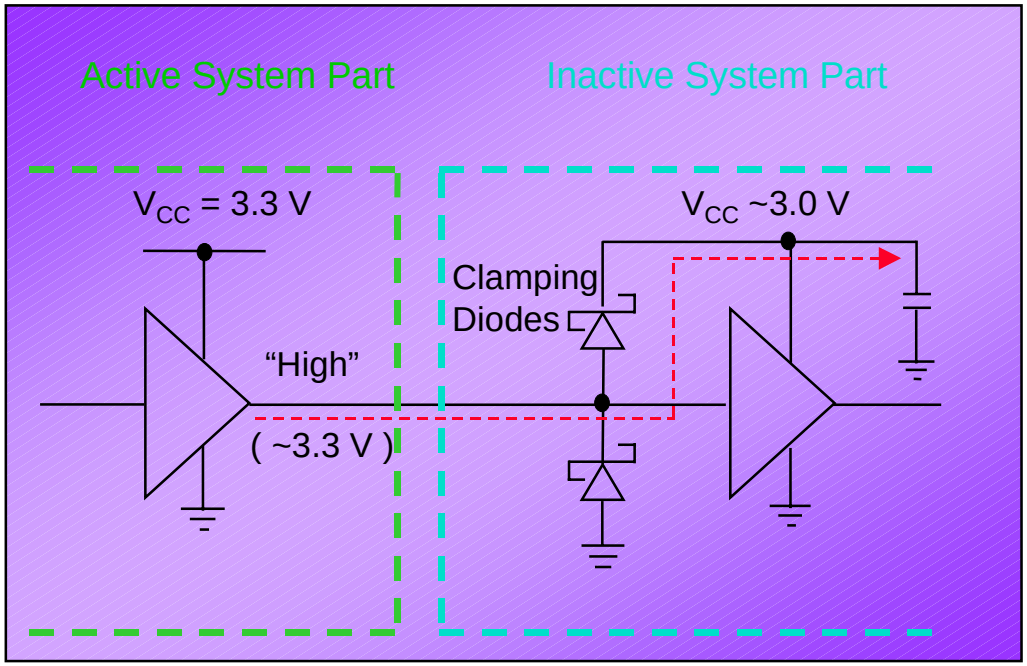
Bus-Hold Input Characteristics





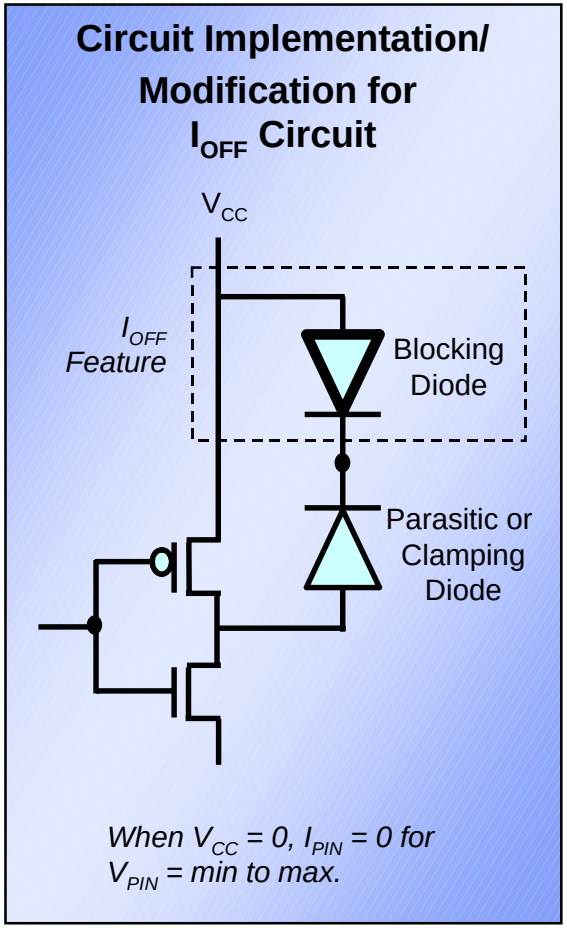
- Holds the last known state of the inputs
- Provides ±74 µA of holding current at 0.8 V and 2.0 V
- Bus hold current does **not** load the driving output at a valid logic level
- Negligible input/output capacitance impact (0.5 pF)
- Eliminates the need for external resistor on unused or floating I/O pins
- Reduces the number of passive components per board
- Bus-hold nomenclature : SN74xxxHxxx; e.g., SN74LVCH245

Partial-Power-Down Applications



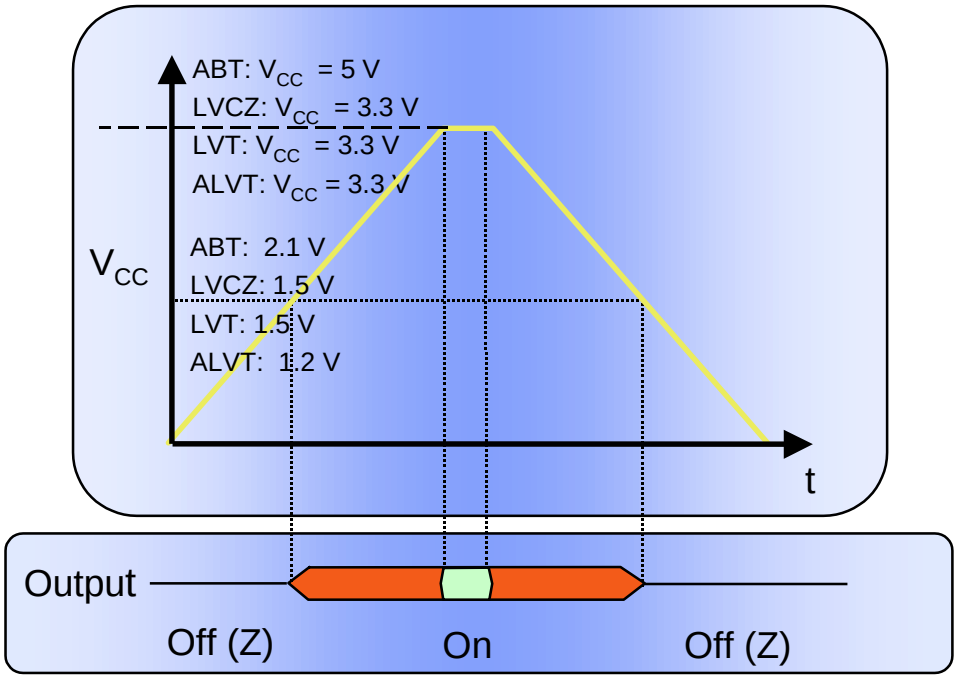
Logic Family I_{OFF} Specification

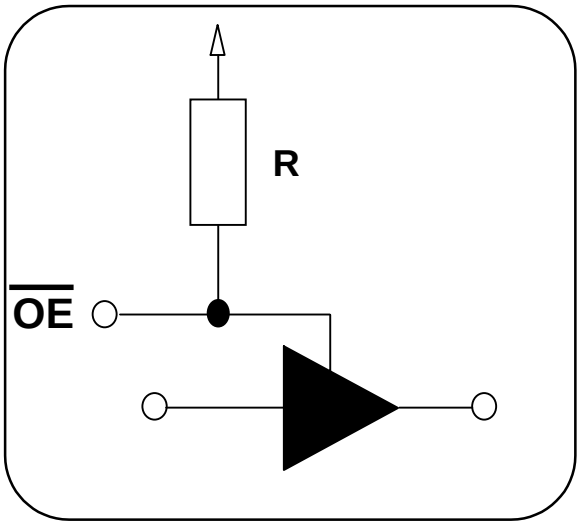
GTL, ABT, LVT, ALVT	: ±100 µA
GTLP	: ±30 µA
LVC, AVC	: ±10 µA
LV	: ±5 µA



- Unexpected device behavior during partial powering may cause system failure.
- Input signals may source current via input clamping diodes of powered-down circuits.

Power-Up 3-State/Hot Insertion



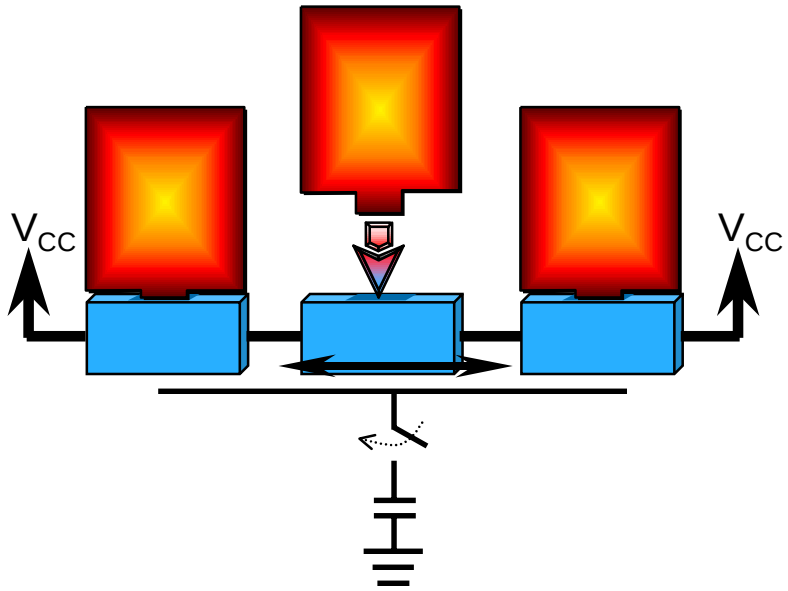


Tie external resistor from OE line to V_{CC}

- OE follows V_{CC}, ensuring device remains in 3-state (Z) during power up/power down
  - See I_{OFF} and $I_{OZ(PU/PD)}$ on data sheet
- Devices tested at ramp rates of 200 µs/V–20 µs/V

Live Insertion

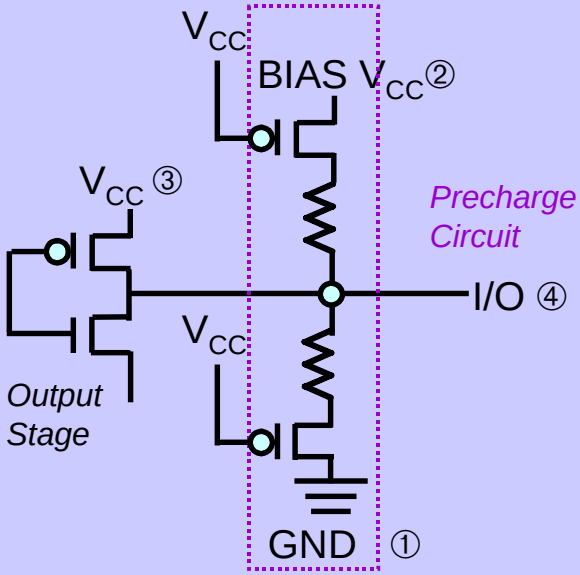
System Function/Capability

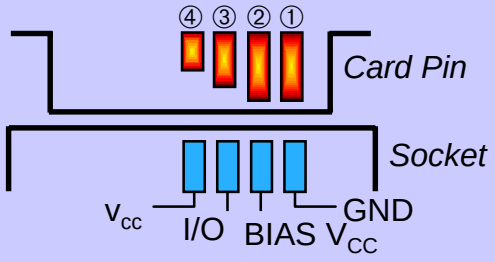


Supporting Device Specifications

I_{OFF}
I_{OZPU}
I_{OZPD}
V_O, V_{CC} = 0, BIAS V_{CC} = Min to Max

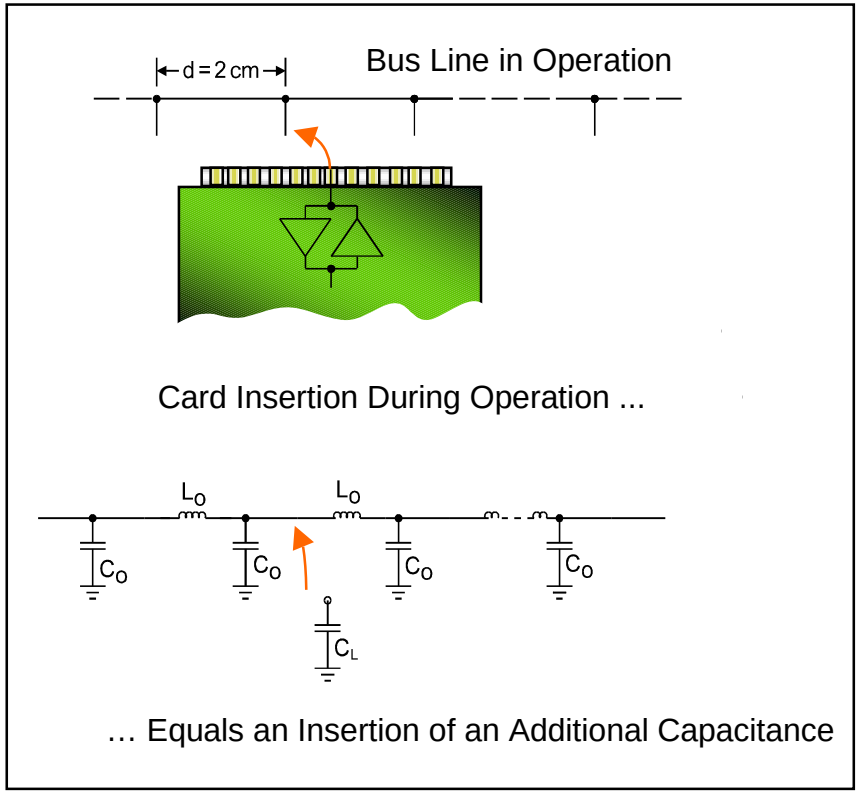
Circuit Implementation/ Modification Precharge Circuit



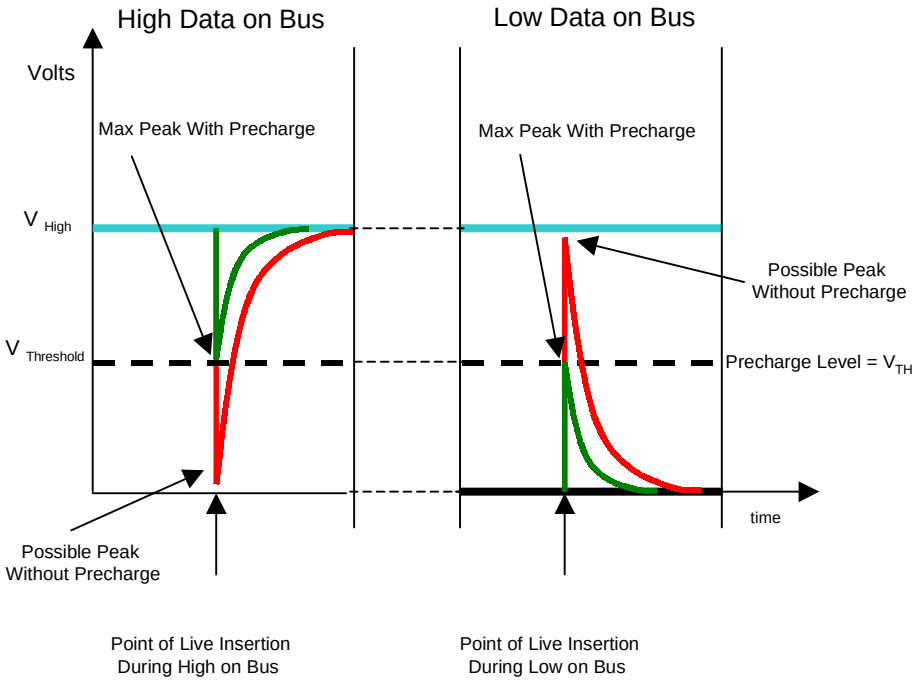


Precharge Function Avoids Data Corruption (BIAS V_{CC})

Live-Insertion Situation

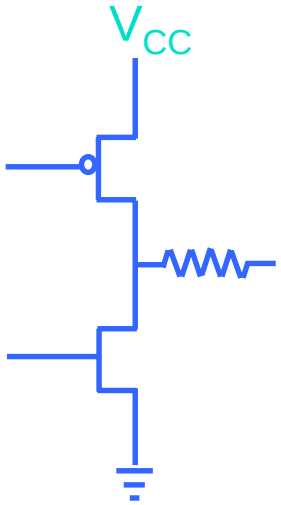


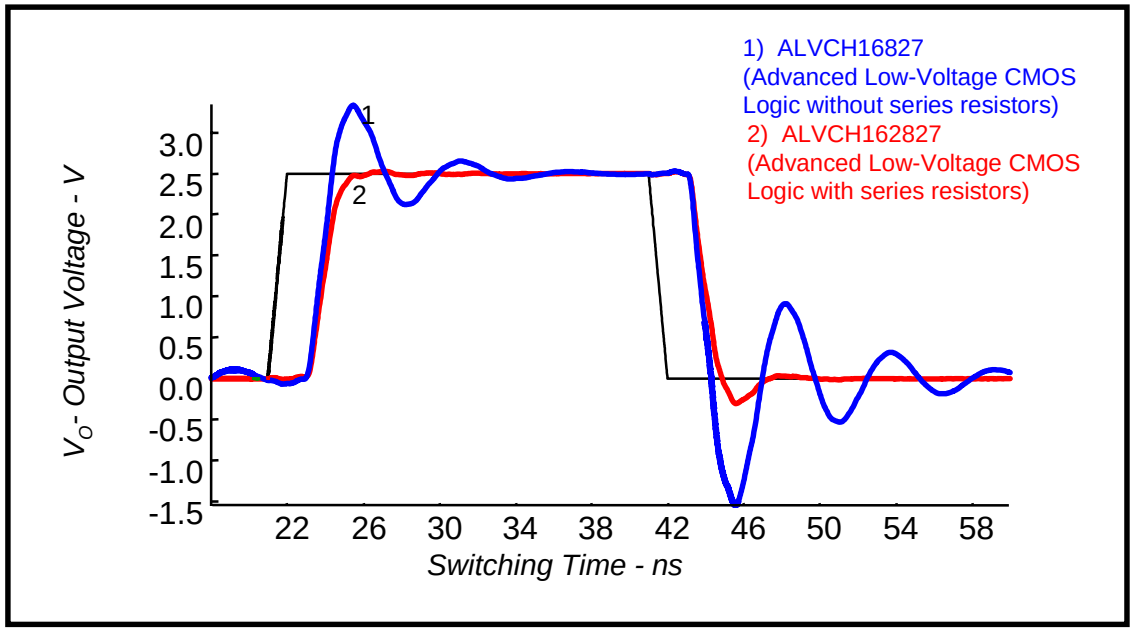
Possible Scenarios



- **V_{BIAS} charges I/O capacitance up to threshold voltage**

Damping Resistors





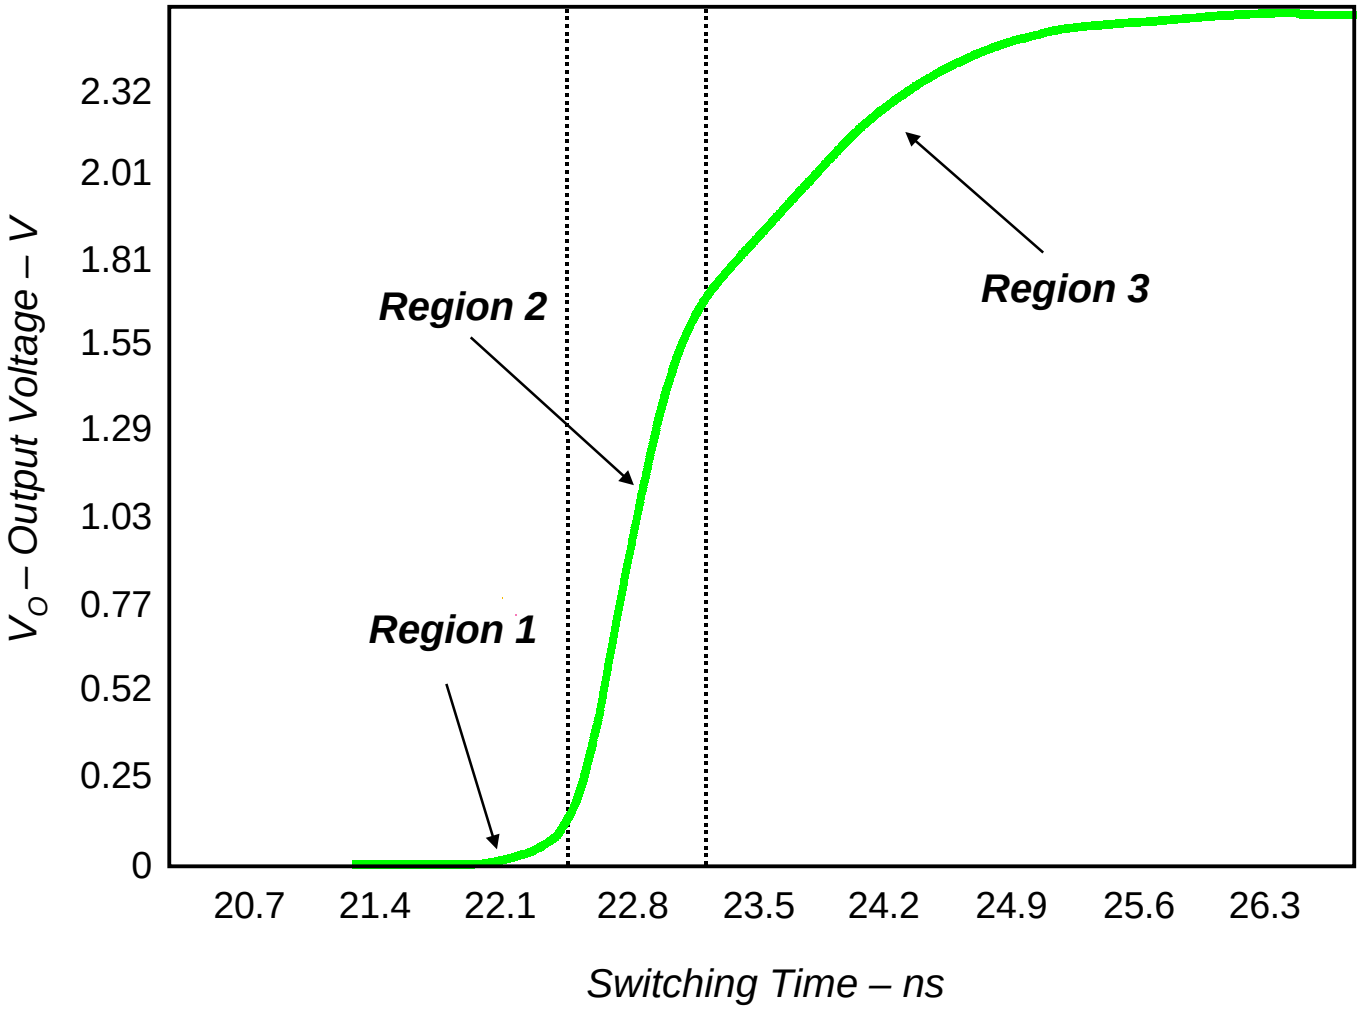
- Limits the current to reduce noise from undershoot or overshoot
- Aids in line termination (reducing ringing/line reflection to improve signal quality)
- Series resistor at output stage
- Short propagation delays and low power consumption
- Supports highest system performance and/or use of slower memories
- Reduces component count, board space, and mounting costs

Examples: **’ALVCH2245**
’ALVCH162245
‘ALVCHR16245

Extra “2” in device name indicates damping resistor on outputs only; “R” indicates both A and B ports.

DOC™ Circuitry Provides the Best-Possible Signal Integrity Without Compromising Speed

DOC uses high drive only when needed (during transition)



Region 1

- Low drive during steady state signal

Region 2

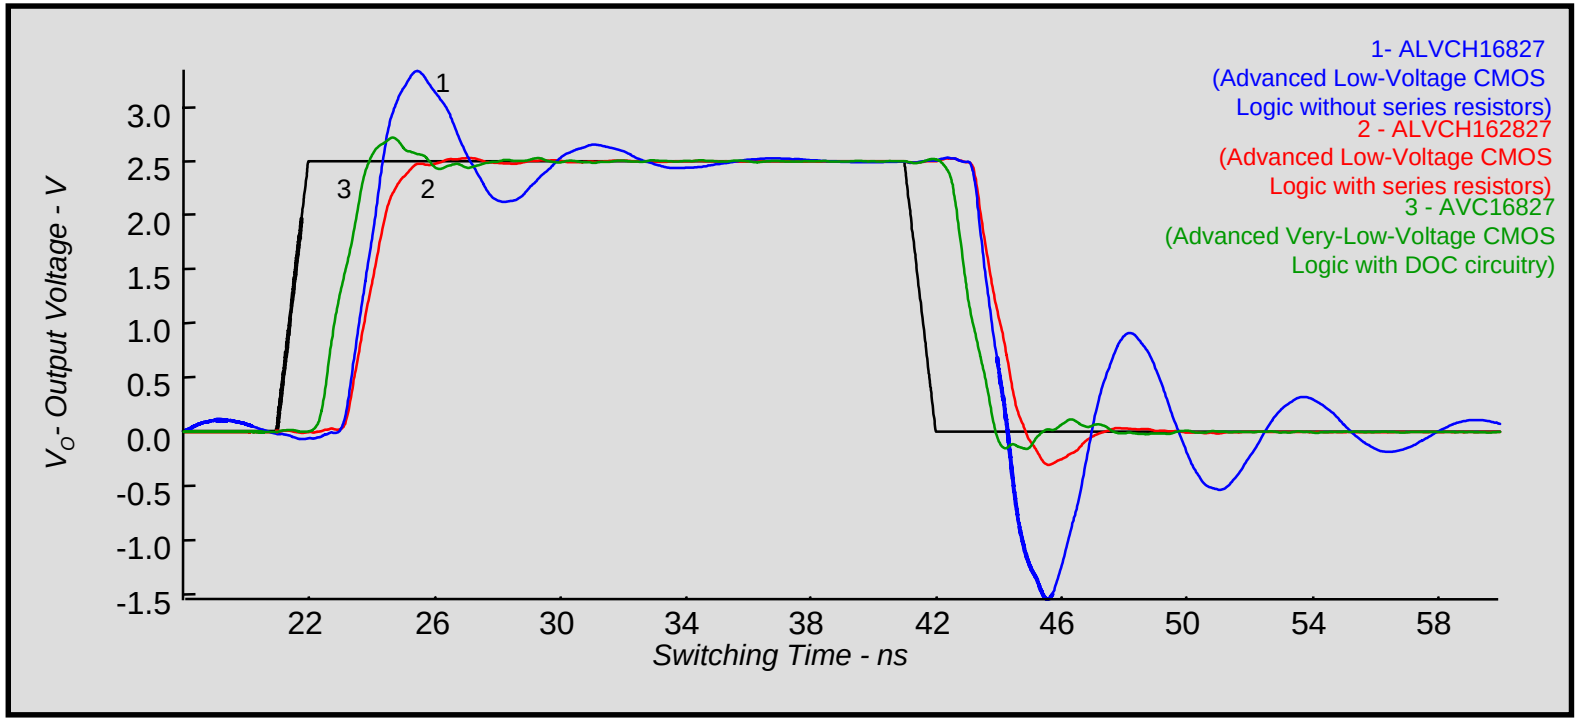
- Output impedance is dynamically lowered during signal transition to drive the line

Region 3:

- Output impedance is dynamically raised to reduce noisy signal overshoots and undershoots

DOC™ Circuitry Available With AVC

DOC uses high drive only when needed (during transition)



The DOC Circuit

Delivers high drive current to achieve maximum speed

Reduces overshoot and undershoot normally associated with fast edges

Eliminates the need for damping resistors

Output waveforms are taken driving
a PC100 network load.

Advanced-Logic Feature List

- **Mixed-voltage-tolerant I/Os and level shifting – LV, LVC, ALVC, LVT, ALVT, AVC, GTL, GTLP**
  - Systems use mixed supply voltages and TLL or CMOS levels in many designs. Most advanced-logic families allow mixed-signal interfacing and provide level-shifting functions for certain mixed-voltage applications.
- **Bus hold – CBT†, ABT†, LVC†, ALVC†, LVT†, ALVT, AVC†, GTL, GTLP**
  - Bus-hold circuitry in selected logic families helps solve the problem of floating inputs and eliminates the need for pullup or pulldown resistors by holding the last known state of the input. See $I_{I(HOLD)}$ on data sheet.
- **Partial power down – I_{OFF} – ABT, LV, LVC, LVT, ALVT, AVC, GTL, GTLP**
  - I_{OFF} circuitry prevents the device from being damaged during hot insertion. See I_{OZPU}, I_{OZPD}, I_{OFF} specifications on data sheet.
- **Power-up 3-state – ABT, LVT, ALVT, LVC, GTLP**
  - Power-up 3-state ensures valid output levels during power up and valid Z on the outputs during power down.
- **BIAS V_{CC} – GTLP, ABTE, FB, CBT, CBTLV, GTL (1655 only)**
  - V_{BIAS} precharges I/O capacitance up to threshold voltage, preventing glitching of active data.
- **Series damping resistors – ABT†, LVC†, ALVC†, LVT†, ALVT†**
  - Series damping resistors limit signal overshoot and undershoot by providing better impedance matching and line termination without the need for external resistors.
- **DOC™ circuit – AVC**
  - The revolutionary DOC™ circuitry automatically lowers circuit output impedance during signal transition and later raises it after signal transition to reduce noise.
- **JTAG – ACT, BCT, ABT, LVT**

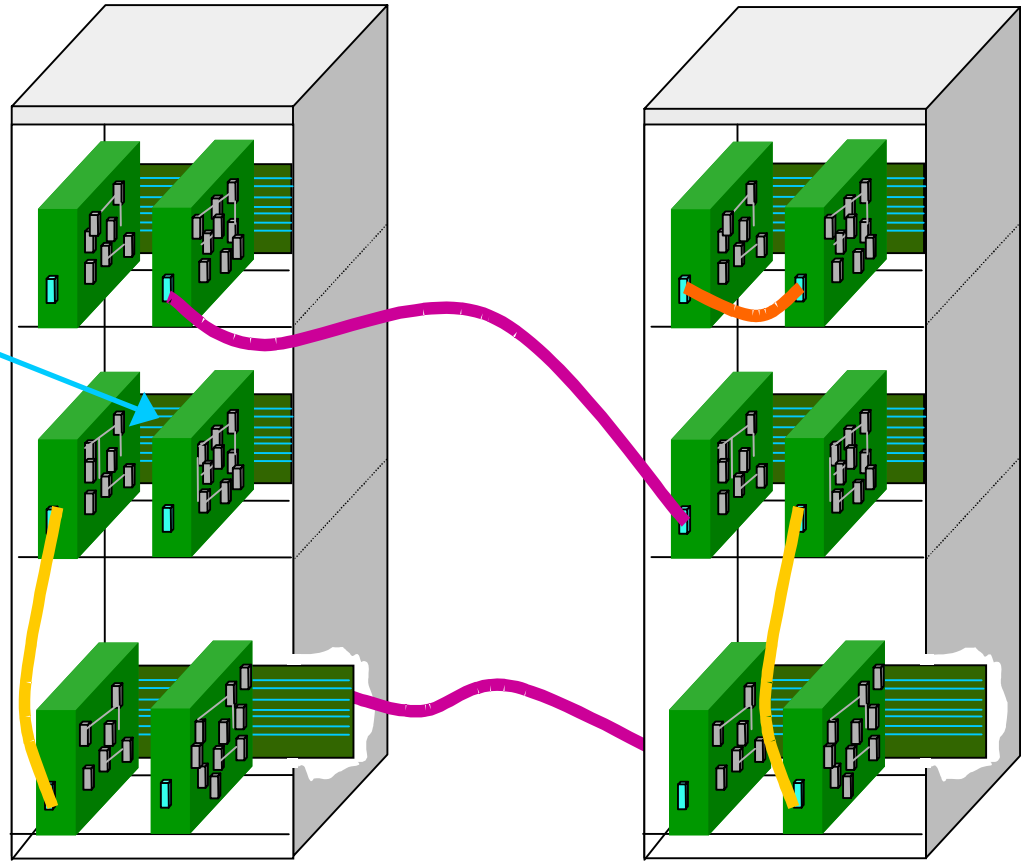
High-Performance Bus Solutions for System Connections

Card-Card Connection
Over backplane multipoint to multipoint, using GTLP, FB+, or VME single ended or LVDM differential

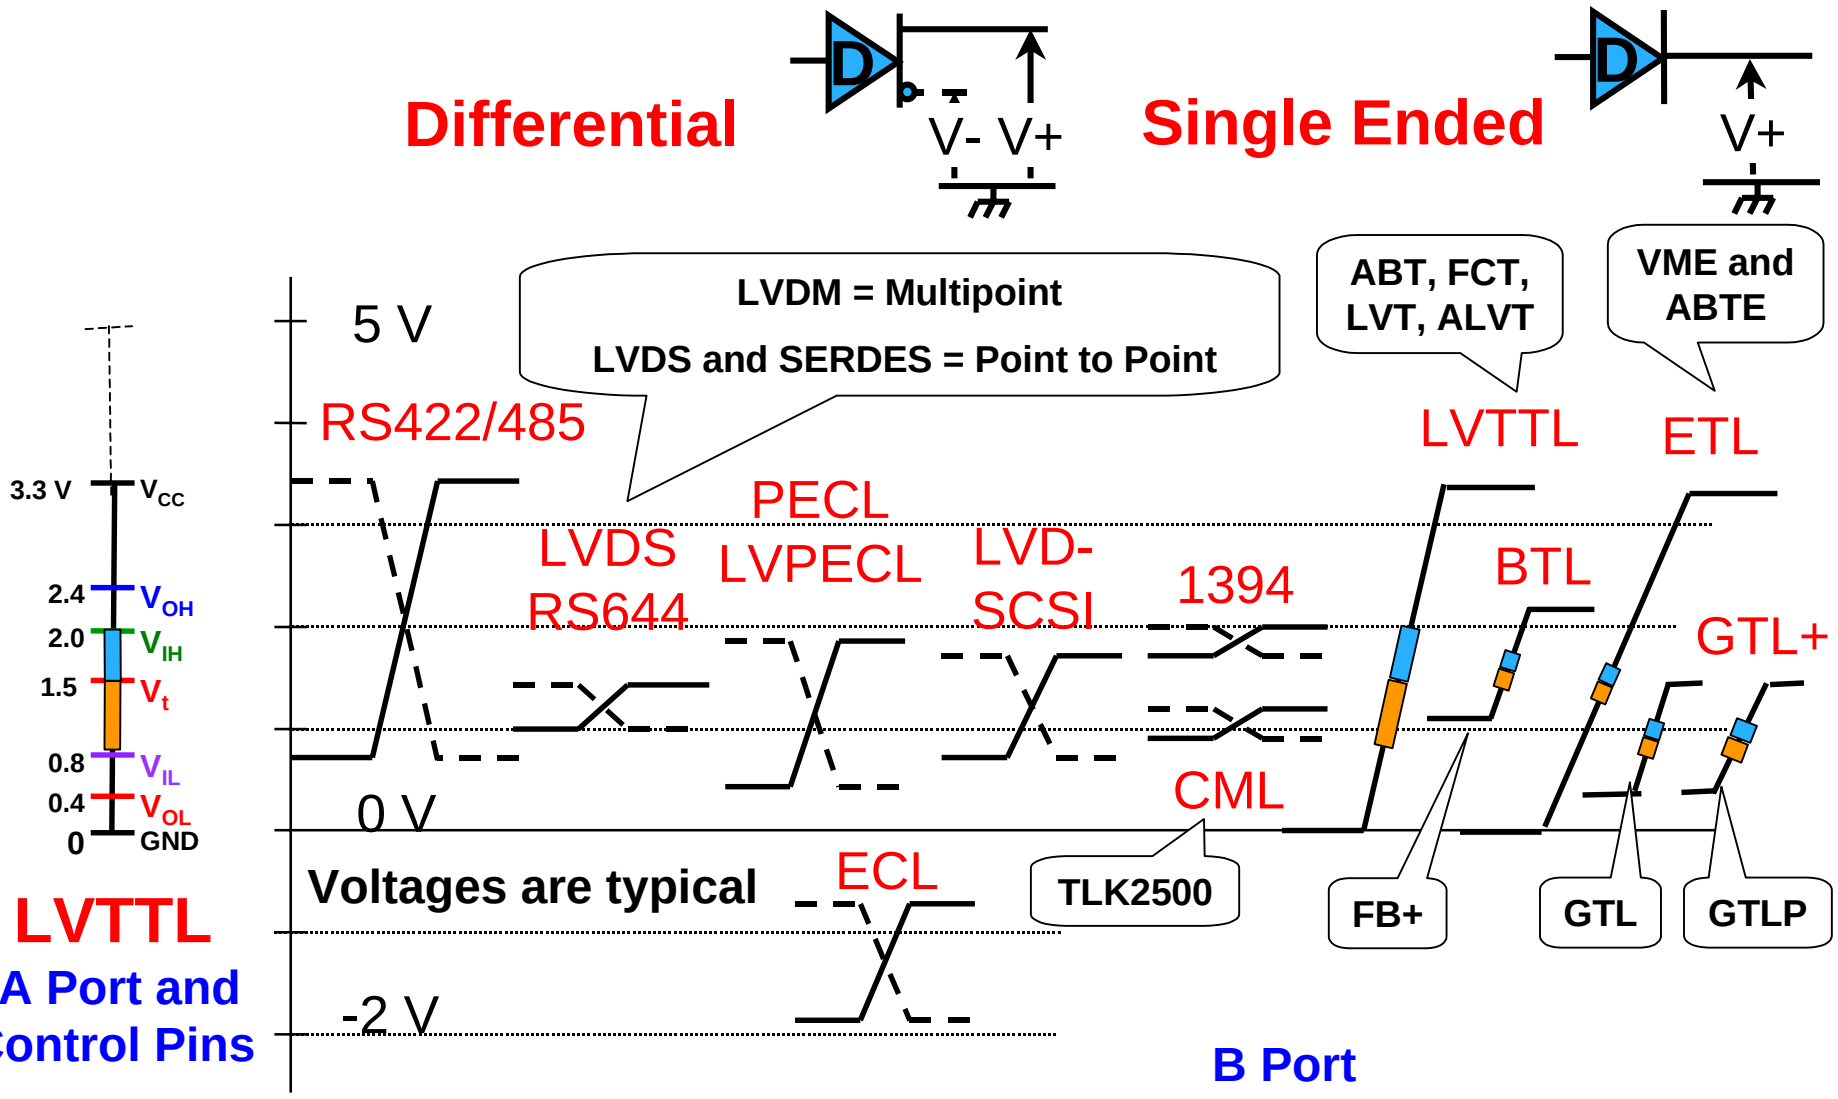


Card-Card Connection
Point to point, using LVDS, SERDES (example: TLK2501 etc.)

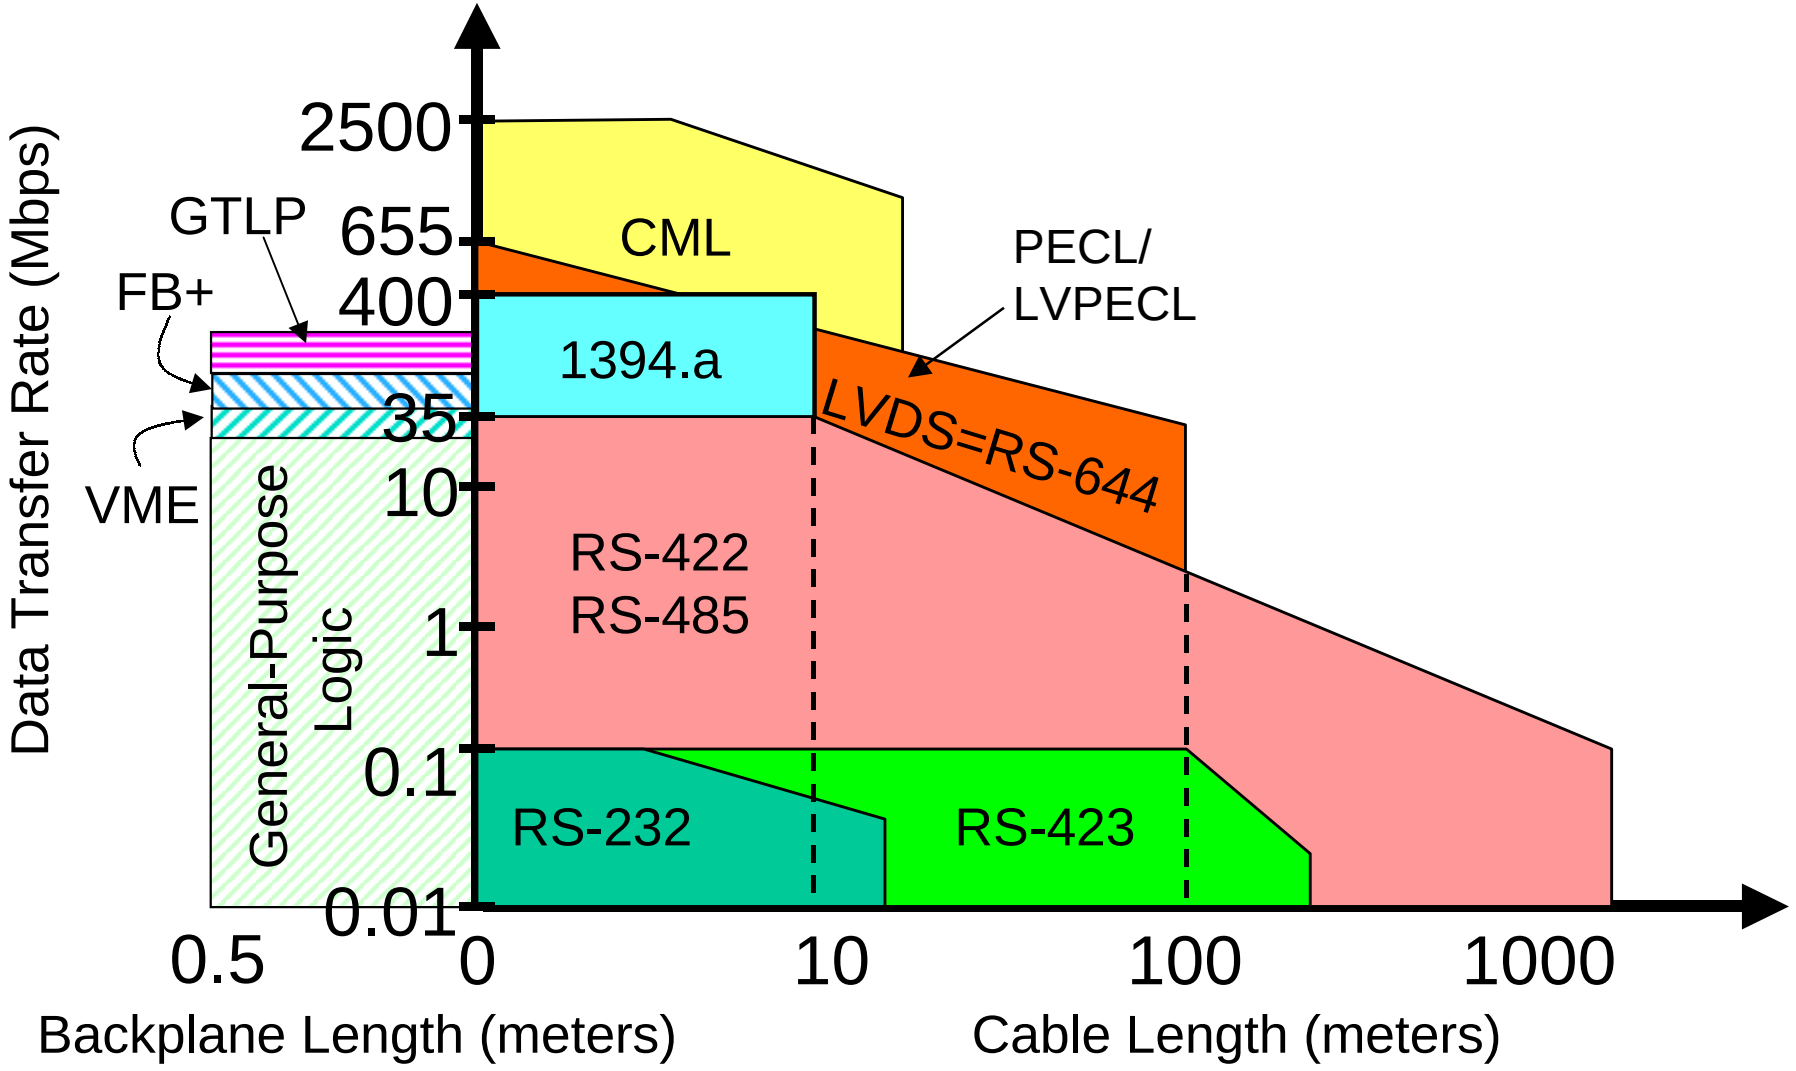
Rack-Rack Connection
Point to point, using LVDS or PECL

Cabinet-Cabinet Connection
- Backplane to backplane with SERDES (example: TLK2500, etc.)
- Card to card with SERDES (example: TLK2501, etc.)

Every Bus Solution Is a Translator

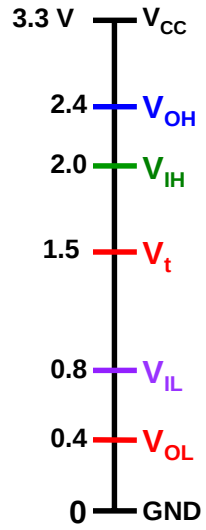


Data Rate vs Transmission Length

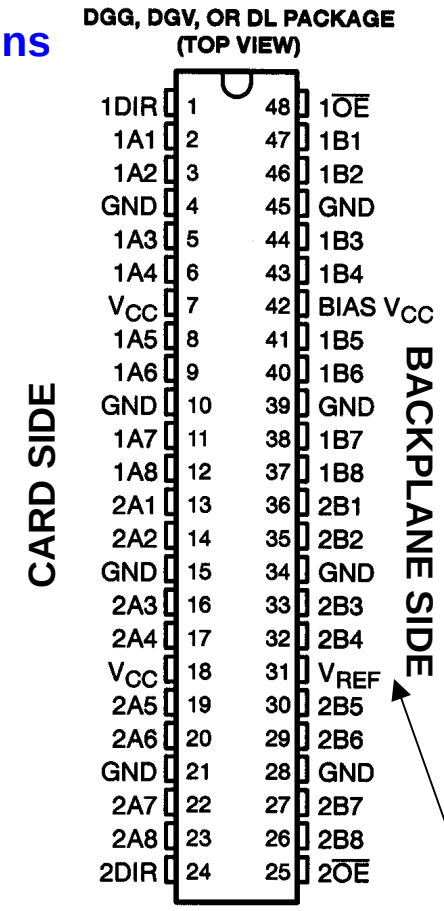


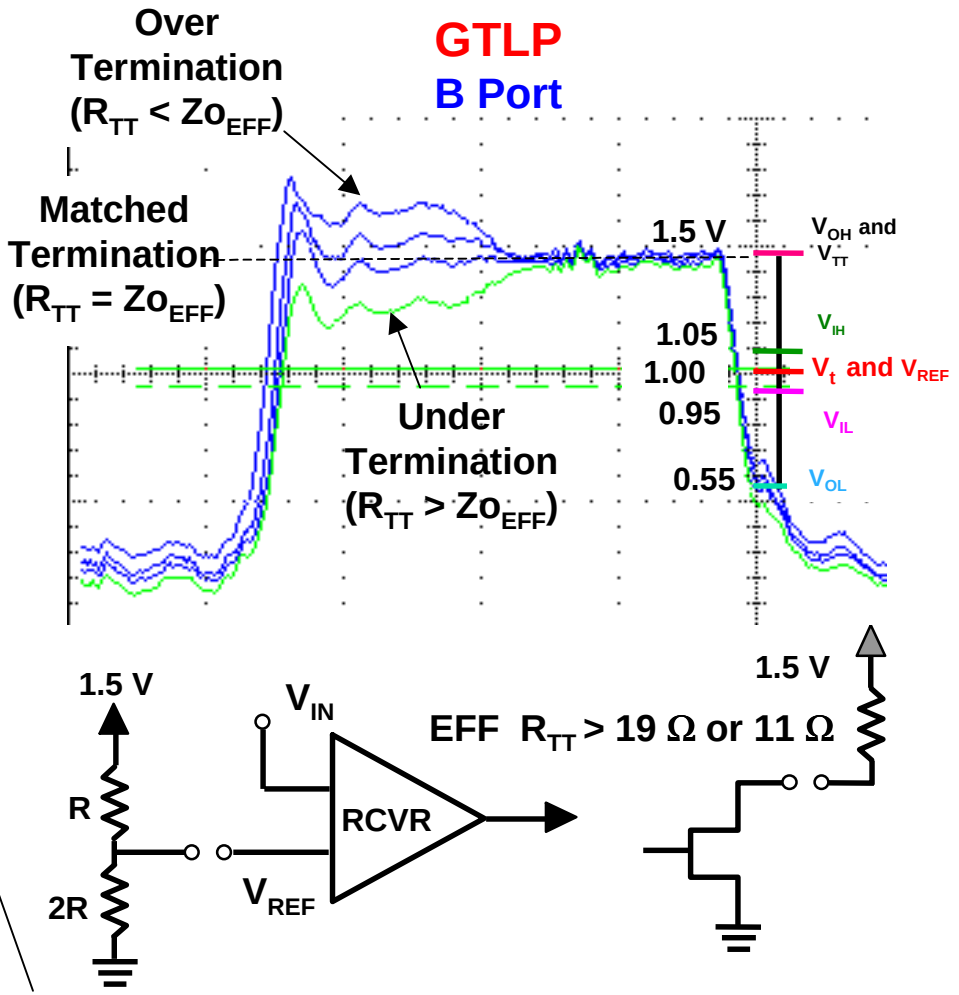
GTLP Is a High-Performance Backplane Translator

LVTTL
A Port and Control Pins



5-V Tolerant
Drive +/-24 mA
Bus-Hold Option
0.65-μ CMOS
Flow-Through Pinout





Differential Input

Open Drain
Sink 50 mA or 100 mA

AVC – Advanced Very-Low-Voltage CMOS

Fastest Logic Family Available - Sub 2 ns Max t_{pd}

NEW FAMILY

Features

- V_{CC} Specified at 3.3 V, 2.5 V, and 1.8 V
- 3.3-V I/O Tolerance
- Bus Hold
- I_{OFF} for Partial Power Down
  - ±10 µA
- Dynamic Drive Through DOC™ Circuit

Device	V_{CC}	Drive	$T_{PD(MAX)}$
SN74AVC16244	3.3 V	–12/12 mA (Static)	1.7 ns
SN74AVC16244	2.5 V	–8/8 mA (Static)	1.9 ns
SN74AVC16244	1.8 V	–4/4 mA (Static)	3.2 ns

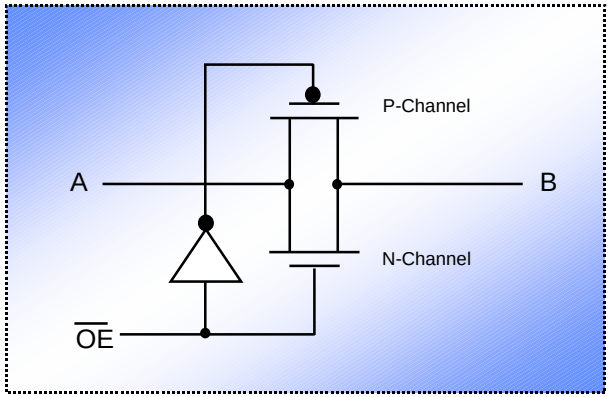
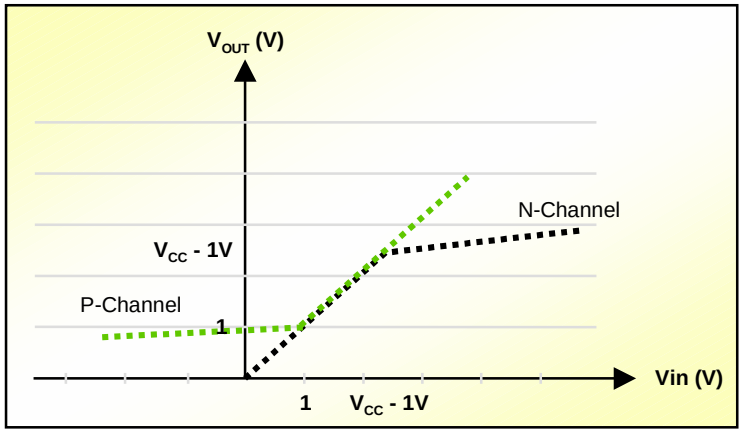
CBT Features

- Level shifting
  - SN74CBTDxxx
- Precharged outputs
  - SN74CBT6800

CBTLV Circuit Diagram



CBTLV V_{IN}/V_{OUT} Graph



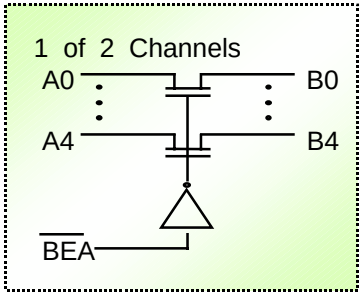
CBTLV Features

- No level shifting
- Precharged outputs
  - SN74CBTLV16800

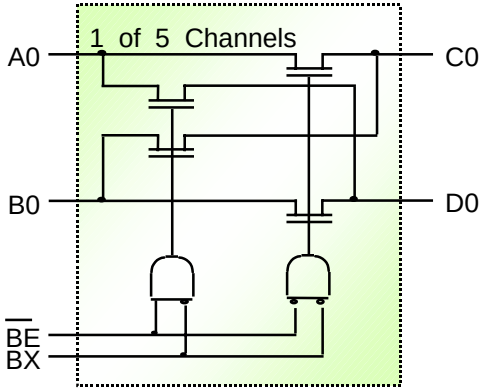
CBT/CBTLV Product Family

Extremely low propagation delays make crossbar switches an effective replacement for drivers and receivers in high-speed systems in which signal buffering is not required.

CBT/CBTLV3384 Bus Switch



CBT/CBTLV3383 Bus Exchanger



*Widebus and Shrink Widebus are trademarks of Texas Instruments.

What Are Bus Switches (CBT/CBTLV)?

- Simple FET switches specified at 5 V (CBT) and 3.3 V, 2.5 V (CBTLV) **support easy bus communication between devices, i.e., memory and ASIC**
- **Near-zero propagation delay** enables highest system speed
  - $t_{pd(MAX)}$ = 0.25 ns for both CBT and CBTLV
- **Very low power consumption** makes them ideal for portable systems
  - $I_{CC(MAX)}$ = 50 µA for CBT and $I_{CC(MAX)}$ = 20 µA for CBTLV

Where Are CBT Switches Used?

- Wide application: **PCs, workstations, hard disk drives, bus boards, 5-V to 3-V translators, hot-card insertion, telecommunication equipment**
- CBTxxxx - Functionally equivalent to QSxxxx
- CBTLVxxxx - Functionally equivalent to PI3Bxxxx

Which Package to Choose

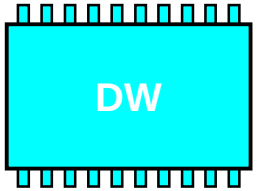
- Industry **standard pinouts** ('244, '245)
- **Fine-pitch packaging** (SOIC, SSOP,TSSOP,TVSOP, Widebus™, Shrink Widebus™
- **Single bus switch SN74CBT/CBTLV1G125...** NOW AVAILABLE!!!
- **CBT6800 and CBTLV16800 bus switch with precharged outputs available**

Literature

- **New CBT/CBTLV Selection Guide** (literature number SCDB002)
- **New CBT/CBTLV Data book** (literature number SCDD001C)

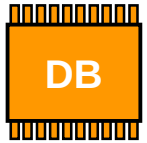
Packaging Options

8 Bits



20-Pin SOIC
Area = 137 mm^2
Ht. = 2.65 mm
LP = 1.27 mm

8 Bits

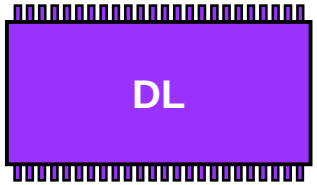


20-Pin SSOP
Area = 62 mm^2
Ht. = 2.0 mm
LP = 0.65 mm

8 Bits

20-Pin TSSOP
Area = 46 mm^2
Ht. = 1.1 mm
LP = 0.65 mm

16/18 Bits Widebus™



48-Pin SSOP
Area = 171 mm^2
Ht. = 2.74 mm
LP = 0.635 mm

16/18 Bits Shrink Widebus™

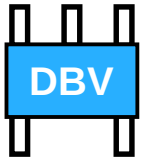
48-Pin TSSOP
Area = 108 mm^2
Ht. = 1.1 mm
LP = 0.5 mm

16/18 Bits Widebus™

48-Pin TVSOP
Area = 63 mm^2
Ht. = 1.2 mm
LP = 0.4 mm

Single Gate

(Magnified 2.5X for detail)



5-Pin SOT
Area = 8.12 mm^2
Ht. = 1.2 mm
LP = 0.95 mm

5-Pin SOT
Area = 4.2 mm^2
Ht. = 1.0 mm

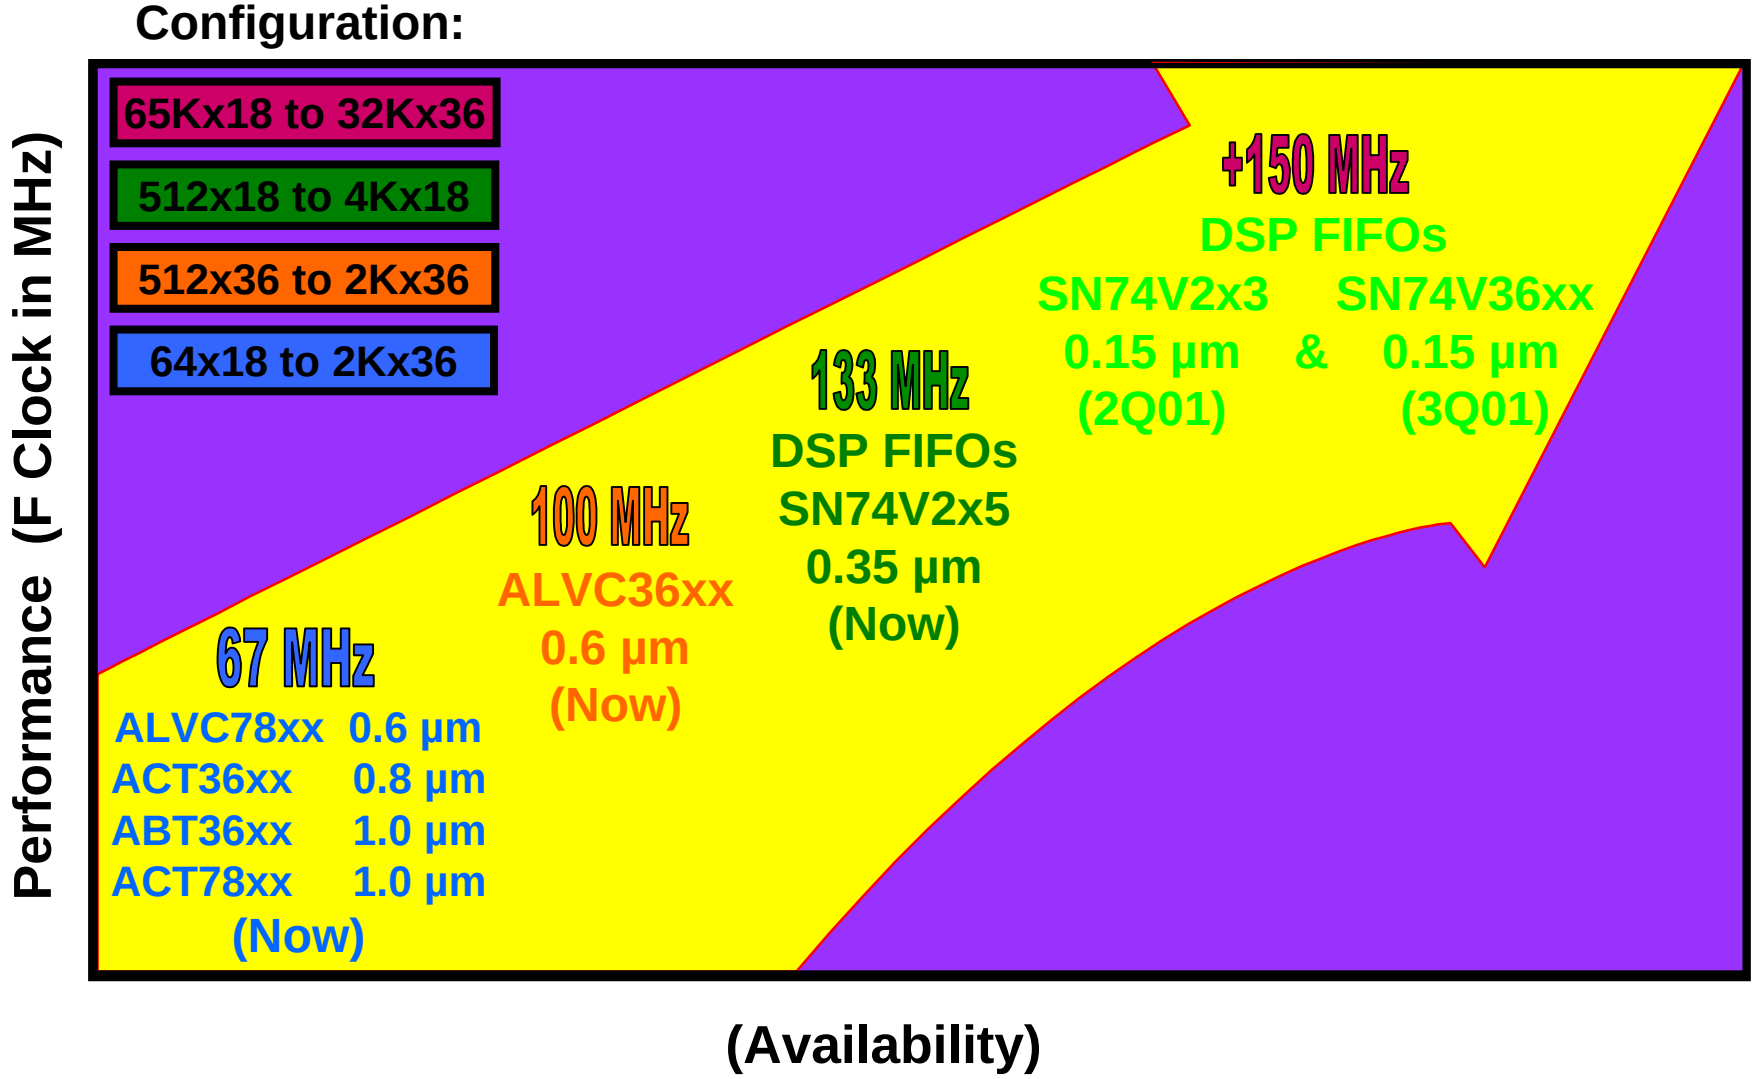
TI DSP-Related FIFO Products

- New TI FIFOs Offer a *DSP Glueless Interface* to Leading Edge TI DSPs
- TI Technology Leadership Creates World-Class FIFO Performance
- TI Manufacturing Excellence Ensures the Lowest Total Cost of Ownership

TI FIFO Product and Technology Roadmap



Typical FIFO Applications and End Equipment

Typical Applications:

Bus-to-Bus Speed Matching
Clock Synchronization
Data Acquisition
DSP Interface
Elastic Stores
I/O Buffering
Microprocessor Interface
Slip Buffers
Transmit Buffer

Typical End Equipment:

Accelerator Cards
ATM/SONET
Digital Signal Processing
Digital TV
Disk Drivers
Workstations
FDDI (Fiber Distr. Data)
Graphics Systems
High-End Computers
High-End Copiers
High-End Printers
Industrial Controls
LAN/WAN
Medical Imaging
Modems
Networking Systems
Parallel Processors
PBX (Private Branch Exch.)
PCMCIA Cards
Routers
Scanners
SCSI Boards
Servers
Switches
Telecom Base Stations
Video Telecom
VME Boards

SECTION 2
FOCUS ON THE HISTORY OF LOGIC

CONTENTS

The Transistor

It is December 1947, and two researchers at Bell Telephone Laboratories, John Bardeen and Walter Brattain, have just demonstrated their invention to their team leader, William Shockley. Their invention is the first working transistor.

Fast-forward 11 years.

The Integrated Circuit

In a deserted laboratory at the brand-new Semiconductor Building owned by Texas Instruments, Jack Kilby first hits on the idea of the integrated circuit. In July 1958 most employees had left for mass vacation. Because Kilby was new to the company and didn't have much vacation, he stayed to man the lab.

What caused Kilby to think along the lines that eventually resulted in the integrated circuit? Like many inventors, he set out to solve a problem. In this case, the problem was called "the tyranny of numbers," where the interconnection of individual components offered too many potential points of failure.

For nearly all of the first 50 years of the 20th century, the electronics industry had been dominated by vacuum-tube technology. But vacuum tubes were unreliable, bulky, power-hungry, and hot. The invention of the transistor solved the problems of the vacuum tube. By comparison, transistors were tiny, more reliable, and longer lasting. They also produced less heat and used less power. The transistor inspired engineers to design increasingly complex electronic circuits and equipment containing hundreds or thousands of discrete components. But these components still had to be connected together to form complete circuits; hand wiring and soldering of thousands of components was expensive and time consuming. It also was unreliable; every soldered joint was a potential trouble source. The challenge was to find cost-effective, reliable ways to produce and interconnect these components.

One attempt at a solution was the Micro-Module program sponsored by the U.S. Army Signal Corps. The idea was to make all the components a uniform size and shape, with the wiring built in. The modules then could be snapped together to make circuits, eliminating the need for wiring the connections.

TI was working on the Micro-Module program when Kilby joined the company in 1958. Previous jobs had familiarized him with the "tyranny of numbers" problem facing the industry, but he doubted that the Micro-Module was the answer, as it did not address the basic problem of high component count in elaborate circuits.

Kilby began searching for an alternative, and during that search decided the only thing a semiconductor house could make cost effectively was a semiconductor. "Further thought led me to the conclusion that semiconductors were all that were really required, that resistors and capacitors, in particular, could be made from the same material as the active devices. I also realized that, since all of the components could be made of a single material, they could also be made in situ interconnected to form a complete circuit," Kilby wrote in a 1976 article titled *Invention of the IC*.

Kilby began to write and sketch his ideas in July 1958. By September, he was ready to demonstrate a working integrated circuit built on a piece of semiconductor material. Several executives, including former TI chairman Mark Shepherd, gathered on September 12, 1958. What they saw was a sliver of germanium, with protruding wires, glued to a glass slide. It was a rough device, but when Kilby pressed the switch, a sine wave appeared on the attached oscilloscope. His invention worked!

Kilby had made a big breakthrough. But while the U.S. Air Force showed some interest in TI's integrated circuit, industry reacted more skeptically. Indeed, the IC and its relative merits "provided much of the entertainment at major technical meetings over the next few years," Kilby wrote. Kilby received co-credit for the invention of the integrated circuit with Robert Noyce, who had been working separately at the time on a similar project at Fairchild. Noyce died in 1990. Kilby was later awarded a Nobel Prize in physics (October 2000) in part for this work.

The integrated circuit won acceptance in the military market through programs such as the first computer using silicon chips for the Air Force in 1961 and the Minuteman Missile in 1962. Recognizing the need for a "demonstration product" to speed widespread commercial adoption of the IC, former TI chairman Patrick E. Haggerty challenged Kilby to design a calculator as powerful as the large, electromechanical desktop models of the day, but small enough to fit in a coat pocket. The resulting electronic handheld calculator, of which Kilby is a co-inventor, successfully commercialized the integrated circuit.

The Logic Business Begins

Once the idea of the integrated circuit was developed, it was obvious that many standard and often-used circuits could be built into a single package, and several of these prepackaged modules or semiconductor networks could be connected to form useful and much more complicated circuits. Early standard circuits included logic functions; OR gates, AND gates, and flip-flops.

Types of Logic

The first commercially available IC made by TI (1959/1960) was the SN502 microelectronic binary flip-flop, a simple gate with mesa construction and wire interconnections at a sample quantity price of $500 each. The first true catalog ICs were resistor-transistor logic (RTL) and series-51 resistor-capacitor-transistor logic (RCTL) devices, first available in 1960/1961, at a price of $200 per unit. At hundreds of dollars per unit, the cost of these early integrated circuits was astronomical in today's terms.

Diode-transistor logic (DTL) was an evolutionary step in improving speed, power, and semiconductor yields. Transistor-transistor logic (TTL) was a direct result of this evolution. Many TTL "flavors" were developed to offer the right mix of speed and power demanded in the marketplace. High-speed (H) and low-power (L) series were variations on transistor gain and resistor values. Schottky (S or STTL) added Schottky diodes to increase speed by preventing transistor saturation. Further market-driven requirements for lower power; better reliability, smaller packages, and/or higher speeds, resulted in low-power Schottky (LS or LPS), advanced low-power Schottky (ALS), and advanced Schottky (AS). With the exception of the DTL, RTL, and L and H TTL families, these products are still available.

The development of complementary metal-oxide semiconductor (CMOS) technology began a new branch of logic families. As with the earlier bipolar logic, different families with different speeds and capabilities developed. High-speed CMOS (HC) led to advanced CMOS logic (ACL). This development, again market driven, gave improved speeds with low CMOS power requirements and greatly improved output noise. A mixture of CMOS and bipolar processes resulted in the BiCMOS technology using internal CMOS components and high-power bipolar outputs. Several different families evolved from the original BiCMOS processes. Development and evolution of logic continues today. TI offers a complete line of logic products in bipolar, BiCMOS, and CMOS technologies.

Logic products changed to meet the needs of the equipment in which they were used. First were the simple gates, then 4-bit-wide functions. The first 8-bit buses drove development of the various octal functions. Higher bandwidth and throughput drove the development of wider and wider bit widths; Widebus™ for 16-bit buses, Widebus+™ for 32-bit buses. Even wider bit widths are now available or in development. Similarly, one- and two-bit products in very small packages have reappeared for simple fixes or where only a single or a pair of functions are needed.

Similar changes are being made in the operating voltages and package types and sizes. At first, most logic operated at 5 volts. Now, much of the logic used is 3.3 volts, which, in combination with CMOS technologies, has dramatically improved transition times, noise margins, and total overall power needs. As power requirements are reduced and higher bit widths are used, packages change as well. The pin counts are higher, but the package sizes become smaller, allowing a far greater overall circuit density than ever before.

The Logic Time Line

1958 – Jack Kilby invents the integrated circuit

1960 – **R**esistor-**T**ransistor **L**ogic (RTL) introduced.

1961 – **D**iode-**T**ransistor **L**ogic (DTL) introduced.

1964 – **T**ransistor-**T**ransistor **L**ogic (TTL) announced by TI.

1965 – TI Sherman (Texas) plant opens to manufacture custom ICs for IBM.

1972 – **L**ow-power **S**chottky and **S**chottky (LS, S) announced by TI. ABACUS II (**A**lloy, **B**ond, **A**ssembly **C**oncept, **U**niversal **S**ystem) bonding equipment brought to production.

1975 – Series 4000 CMOS technology introduced.

1980 – **H**igh-Speed **C**MOS logic (HC/HCT) introduced.

1981 – **A**dvanced **L**ow-Power **S**chottky and **A**dvanced **S**chottky (ALS, AS) introduced by TI.

1983 – HC/HCT product announced by TI.

1984 – TI begins manufacture of **74F** product (TI nomenclature for FAST™ technology).

1985 – **F**ast **C**MOS **T**echnology (FCT) logic introduced.

1986 – **A**dvanced **C**MOS **L**ogic (AC/ACT) with center-pin Vcc and grounds introduced by TI and Signetics.

1987 – **B**i**C**MOS **T**echnology (BCT) announced by TI.

1989 – ACL Widebus, **S**hrink-**S**mall **O**utline **P**ackage (SSOP), and palladium lead finish introduced by TI (Pd replaces solder-dipped lead frames for fine-pitch packages and ultimately all logic packages).

1990 – **A**dvanced **B**iCMOS **T**echnology (ABT) introduced by TI and Philips.

1992 – ABT Widebus introduced by TI (Philips announces MultiByte version), **L**ow-**V**oltage **T**echnology (LVT) announced by TI, **T**hin **S**hrink **S**mall-**O**utline **P**ackage (TSSOP) introduced by TI.

Widebus and Widebus+ are trademarks of Texas Insturments.
FAST is a trademark of Fairchild Semiconductor.

FOCUS ON THE HISTORY OF LOGIC

1993 – **L**ow-**V**oltage **C**MOS Technology (LVC) logic, **L**ow-**V**oltage CMOS Technology (LV) logic, and LVT Widebus introduced by TI.

1994 – **A**dvanced **L**ow **V**oltage **C**MOS Technology Widebus (ALVC) and **C**ross**b**ar **T**echnology (CBT) logic announced by TI.

1996 – **A**dvanced **H**igh-Speed **C**MOS (AHC/AHCT) **A**dvanced **L**ow-**V**oltage **T**echnology (ALVT) logic, and **T**hin **V**ery-**S**mall-**O**utline **P**ackage (TVSOP) introduced by TI.

1997 – Low-Voltage Crossbar Technology (CBTLV) and MicroStar BGA™ **L**ow-Profile, **F**ine-Pitch **BGA** (LFBGA) package introduced by TI, Harris Semiconductor AC/ACT, CD4000, HC/HCT, and FCT products acquired by TI.

1998 – **G**unning **T**ransceiver **L**ogic and **G**unning **T**ransceiver **L**ogic **P**lus (GTL/GTLP) announced by TI.

1999 – **A**dvanced **V**ery-Low-Voltage **C**MOS (AVC) logic introduced by TI, Cypress FCT products acquired by TI.

2000 – MicroStar Junior™ BGA **V**ery **F**ine-Pitch **BGA** (VFBGA) package introduced by TI.

This time line shows the growth and addition of different logic technology families. At the same time the families were evolving, the facilities to build them were changing. Initially, manufacture of logic products was spread across the TI worldwide wafer fabrication and assembly test sites, and the business was managed from Dallas. As the bipolar logic families grew, the wafer fab in Sherman began to source most of it. As wafer fab technology evolved, the Sherman fab became the oldest from a technology point of view, but used the stable processes to streamline the manufacturing flow. S-FAB became one of the most efficient and cost-effective wafer fabs in the world. Most of the logic business management and manufacturing support slowly migrated to Sherman, and today the TI Standard Linear & Logic (SLL) operation calls Sherman home.

Assembly and testing (AT) of TI logic products is in Malaysia and Mexico, with additional units built at other TI and selected subcontractor sites. The trend is to centralize the AT operations at a few very high-volume locations to ensure that per-unit costs are as low as possible.

TI Logic Today

TI is the world leader in logic products. The company offers thousands of different devices in 31 different bipolar, BiCMOS, and CMOS technology families and tens of different functions. TI continues to develop products to operate at lower and lower voltages, while maintaining support for 5 V and above. TI offers logic products designed to operate as low as 1.8 V and as high as 18 V.

The logic-packaging group continues the development of new large and small packages. Recent developments include the 96- and 114-pin thin very-fine-pitch ball grid array packages for 32-bit functions and the 5-pin small-outline transistor package for single gates. Additional capacity and package types will be added to assembly-test sites as market demand and developments warrant. Development of lead-free and reduced-lead packaging processes is continuing.

The Sherman wafer fabrication facility is adding established BiCMOS and CMOS processes, while maintaining needed bipolar and 5-volt capacity. These additions are allowing the introduction of products with lower operating voltages and power requirements to support the growing portable and mobile requirements from the personal computer/personal digital assistant (PC/PDA) and cellular products markets.

SLL has developed an Applications Support group to back up the TI Product Information Center. This group provides in-depth support for customers' logic issues and develops application reports and other support materials. In addition, TI continues to evaluate its competition and negotiate alternate source agreements to ensure a continuous source of supply for customers.

What About Tomorrow?

Logic is migrating from the bipolar and 5-volt products that have long been the standard. Operating voltages are moving lower and lower. Today, 3.3 volt is the norm; tomorrow it will be 2.5 volt or 1.8 volt or lower. SLL is creating products to fill that need. Packages will get smaller and smaller, while pin counts increase, allowing for higher component density and smaller end products. SLL is working with manufacturers to ensure that the newest packages remain assembly friendly.

TI has a long-standing reputation for quality, reliability, and service, and SLL intends to build on that reputation. SLL is your long-term logic supplier. Logic products are are obsoleted on a device-by-device basis when the marketplace shows that the need no longer exists, and customers are offered an opportunity to make needed end-of-life buys.

Please accept this special Ten-Year Anniversary Collector's Edition of the TI Logic Selection Guide. Our first edition was published in 1991, and the document has been published continuously since then. We look forward to another exciting ten years of logic and a Twenty-Year Anniversary Collector's Edition of the Logic Selection Guide.

Thank you for choosing TI Logic Products!

DEVICE SELECTION GUIDE

SECTION 5
DEVICE SELECTION GUIDE

CONTENTS

ABT
Advanced BiCMOS Technology Logic

The ABT family, TI's second-generation family of BiCMOS bus-interface products, is manufactured using a 0.8-μ BiCMOS process. It provides high drive up to 64 mA and propagation delays in the 5-ns range, while maintaining very low power consumption. ABT products are well suited for live-insertion applications with an I_{off} specification of 0.1 mA and power-up 3-state (PU3S) circuitry.

The ABT family offers series-damping-resistor options where reduced transmission-line effects are required. Special ABT parts that provide high-current drive (180 mA) for use with 25-Ω transmission lines also are offered. Advanced bus functions, such as universal bus transceivers (UBT™) emulate a wide variety of bus-interface functions. Multiplexing options for memory interleaving and bus upsizing or downsizing also are provided.

The ABT devices can be purchased in octal, Widebus™, or Widebus+™. The Widebus and Widebus+ packages feature higher performance with reduced noise and flow-through pinout for easier board layout. Widebus+ devices offer input bus-hold circuitry to eliminate the need for external pullup resistors for floating inputs.

See www.ti.com/sc/logic for the most current data sheets.

ABT

commercial package description and availability

LFBGA (low-profile fine-pitch ball grid array)
GKE = 96 pins
GKF = 114 pins

VFBGA (very-thin-profile fine-pitch ball grid array)
GQL = 56 pins (also includes 48-pin functions)

PDIP (plastic dual-in-line package)
P = 8 pins
N = 14/16/20 pins
NT = 24/28 pins

PLCC (plastic leaded chip carrier)
FN = 20/28/44/68/84 pins

QFP (quad flatpack)
RC = 52 pins (FB only)
PH = 80 pins (FIFO only)
PQ = 100/132 pins (FIFO only)

TQFP (plastic thin quad flatpack)
PAH = 52 pins
PAG = 64 pins (FB only)
PM = 64 pins
PN = 80 pins
PCA, PZ = 100 pins (FB only)
PCB = 120 pins (FIFO only)

SOIC (small-outline integrated circuit)
D = 8/14/16 pins
DW = 16/20/24/28 pins

QSOP (quarter-size outline package)
DBQ = 16/20/24 pins

SSOP (shrink small-outline package)
DB = 14/16/20/24/28/30/38 pins
DBQ = 16/20/24
DL = 28/48/56 pins

TSSOP (thin shrink small-outline package)
PW = 8/14/16/20/24/28 pins
DGG = 48/56/64 pins

TVSOP (thin very small-outline package)
DGV = 14/16/20/24/48/56 pins
DBB = 80 pins

SOT (small-outline transistor)
DBV = 5 pins
DCK = 5 pins

ABTE/ETL

Advanced BiCMOS Technology/ Enhanced Transceiver Logic

ABTE, with wide noise margin ETL logic levels on the A port, is backward compatible with existing LVTTL/TTL logic. ABTE devices support the ANSI/VITA 1-1994 specification (VME64) with tight tolerances for transition times and skew. ABTE is manufactured using the 0.8-µ BiCMOS process and provides A-port drive levels up to 90 mA for incident-wave switching. B-port features include bus-hold circuitry eliminating the need for external pullup resistors and 25-Ω series output resistors to dampen signal reflections. Other features include a V_{CC} BIAS pin and internal pullup resistors on control pins for live-insertion protection.

The VMEbus International Trade Association (VITA) established a task group in 1997 to specify a synchronous protocol to double data transfer rates to 320 Mbytes/s or more. The new specification, 2eSST (double-edge source synchronous transfers), is based on the asynchronous 2eVME protocol.

Sustained data rates of 1 Gbyte/s, more then ten times faster than traditional VME64 backplanes with single-edge signaling, are possible by taking advantage of 2eSST's use of both edges of each VMEbus clock and the 21-slot VME320 star-configuration backplane.

TI, in conjunction with VITA, is designing a device to support the 2eSST protocol.

See www.ti.com/sc/logic for the most current data sheets and additional information on this new device.

AC/ACT
Advanced CMOS Logic

TI offers a full family of advanced CMOS logic with a wide range of AC/ACT devices for low-power and medium- to high-speed applications. Products acquired from Harris Semiconductor provide many additional functions. Over 160 AC and ACT device types are available, including gates, latches, flip-flops, buffers/drivers, counters, multiplexers, transceivers, and registered transceivers. The AC/ACT family is a reliable, low-power logic family with 24-mA output current drive at 5-V V_{CC} (AC/ACT) and 12-mA output current drive 3.3-V V_{CC} (AC only).

The family includes standard end-pin products and center-pin V_{CC} and ground-configuration products with output-edge control (OEC™) circuitry. The OEC circuitry, available only with the center-pin products, helps reduce simultaneous switching noise associated with high-speed logic. The center-pin products include 16-, 18-, and 20-bit bus-interface functions packaged in 48- and 56-pin shrink small-outline package (SSOP) and thin shrink small-outline package (TSSOP). These packages allow the designer to double functionality in the same circuit board area or reduce the circuit board area by one-half.

The AC family offers CMOS inputs and outputs while the ACT family offers TTL inputs with CMOS outputs.

See www.ti.com/sc/logic for the most current data sheets.

AHC/AHCT
Advanced High-Speed CMOS Logic

The AHC/AHCT logic family provides a natural migration path for HCMOS users who need more speed in low-power, low-noise, and low-drive applications. The AHC logic family consists of basic gates, octals, and 16-bit Widebus™ functions. TI also offers single-gate solutions, designated with 1G in the device name.

Performance characteristics of the AHC family are:

- Speed – Typical propagation delays of 5.2 ns (octals), about three times faster than HC devices. AHC devices are the quick and quiet solution at 5-V V_{CC} for higher-speed operation.
- Low noise – The AHC family allows designers to combine the low-noise characteristics of HCMOS devices with today's performance levels, without the overshoot and undershoot problems typical of higher-drive devices required to get AHC speeds.
- Low power – The AHC family CMOS technology exhibits low power consumption (40-mA max static current, one-half that of HCMOS).
- Drive – Output-drive current is ±8 mA at 5-V V_{CC} (AHC/AHCT) and ±4 mA at 3.3-V V_{CC} (AHC only).
- The AHC family offers CMOS inputs and outputs, while the AHCT family offers TTL inputs with CMOS outputs.
- Packaging – AHC devices are available in small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), plastic dual in-line package (PDIP), thin shrink small-outline package (TSSOP), thin very small-outline package (TVSOP), and 5-pin small-outline transistor (SOT) package. Selected AHC devices are available in military versions (SN54AHCxx).

Using TI products offers several business advantages:

- Competitive advantage – AHC and competitors' VHC devices have equivalent specifications; therefore, AHC devices are drop-in replacements offering alternate sources. With TI's production capacity, delivery performance, and competitive prices, AHC devices are among the most economical, easy-to-use, and easy-to-get logic products.

See www.ti.com/sc/logic for the most current data sheets.

ALB
Advanced Low-Voltage BiCMOS Logic

The specially designed 3.3-V ALB family uses 0.6-μ BiCMOS process technology for bus-interface functions. ALB provides 25-mA drive at 3.3 V with maximum propagation delays of 2.2 ns, making it one of TI's fastest logic families. The inputs have clamping diodes to limit overshoot and undershoot.

The ALB family currently is available in two functions with Widebus™ and Shrink Widebus™ footprints, with advanced packaging options such as shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), and thin very small-outline package (TVSOP).

See www.ti.com/sc/logic for the most current data sheets.

ALS
Advanced Low-Power Schottky Logic

The ALS family provides over 140 bipolar logic functions.

This family, combined with the AS family, can be used to optimize systems through performance budgeting. By using AS in speed-critical paths and ALS where speed is less critical, designers can optimize speed and power performance in bipolar designs.

The ALS family includes gates, flip-flops, counters, drivers, transceivers, registered transceivers, readback latches, clock drivers, register files, and multiplexers.

See www.ti.com/sc/logic for the most current data sheets.

ALVC
Advanced Low-Voltage CMOS Technology Logic

One of the highest-performance 3.3-V bus-interface families is the ALVC family. These specially designed 3-V products are processed in 0.6-μ CMOS technology, with typical propagation delays of less than 3 ns, current drive of 24 mA, and static current of 40 μA for bus-interface functions. ALVC devices have input bus-hold cells to eliminate the need for external pullup resistors for floating inputs. With over 90 Widebus™ and Widebus+™ devices with series damping resistors and gates and octals on the roadmap, ALVC quickly is becoming the industry standard for many 3.3-V logic applications. The family also features innovative functions that make it ideal for memory interleaving, multiplexing, and interfacing to SDRAMs.

Selected devices in the ALVC family are offered in Widebus footprints with all of the advanced packaging, such as shrink small-outline package (SSOP) and thin shrink small-outline package (TSSOP).

Selected ALVC devices are offered in the MicroStar BGA™ (LFBGA) package. Other devices are offered in the small-outline integrated circuit (SOIC) package, SSOP, TSSOP, and thin very small-outline package (TVSOP).

See www.ti.com/sc/logic for the most current data sheets.

ALVT
Advanced Low-Voltage BiCMOS Technology Logic

ALVT is a 5-V tolerant, 3.3-V and 2.5-V product using 0.6-μ BiCMOS technology for advanced bus-interface functions. ALVT provides superior performance, up to 28% speed improvement compared to similar LVT at 3.3 V, current drive of 64 mA, and pin-for-pin compatibility with existing ABT and LVT families.

ALVT operates at LVTTL signal levels in telecom and networking high-performance system point-to-point or distributed-load backplane applications. ALVT is an excellent migration path from ABT or LVT.

Performance characteristics of the ALVT family include:

- 3.3-V or 2.5-V operation with 5-V tolerant I/O capability for use in a mixed-voltage environment
- Speed – Provides high performance with up to 28% speed improvement over LVT.
- Drive – Provides up to 64 mA of drive at 3.3-V V_{CC} and 24 mA at 2.5-V V_{CC}, yet consumes less than 330 μW of standby power.

Additional features include:

- Live insertion – ALVT devices incorporate I_{off} and power-up 3-state (PU3S) circuitry to protect the devices in live-insertion applications and make them ideally suited for hot-insertion applications. I_{off} prevents the devices from being damaged during partial power down, and PU3S forces the outputs to the high-impedance state during power up and power down.
- Bus hold – Eliminates floating inputs by holding them at the last valid logic state, eliminating the need for external pullup and pulldown resistors.
- Damping-resistor option – TI implements series damping resistors on selected devices, reducing overshoot and undershoot, matching line impedance, and minimizing ringing.
- Packaging – ALVT devices are available in shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), and thin very small-outline package (TVSOP), with selected devices offered in MicroStar BGA™ (LFBGA) packages.

See www.ti.com/sc/logic for the most current data sheets.

AS
Advanced Schottky Logic

The AS family of high-performance bipolar logic includes over 70 functions that offer high drive capabilities.

This family, combined with the ALS family, can be used to optimize system speed and power through performance budgeting where BiCMOS logic is used. By using AS in speed-critical paths and ALS where speed is less critical, designers can optimize speed and power performance.

The AS family includes gates, flip-flops, counters, drivers, transceivers, registered transceivers, readback latches, clock drivers, register files, and multiplexers.

See www.ti.com/sc/logic for the most current data sheets.

AVC
Advanced Very-Low-Voltage CMOS Logic

TI's new AVC logic family provides designers the tools to create advanced high-speed systems with propagation delays of less than 2 ns. Though optimized for 2.5-V systems, AVC logic supports operating voltages between 1.2 V and 3.6 V. The AVC family features TI's Dynamic Output Control (DOC™) circuitry, which dynamically lowers circuit output impedance during signal transition for fast rise and fall times, and then raises the impedance after signal transmission to reduce ringing.

Trends in digital electronics design emphasize lower power consumption, lower supply voltages, faster operating speeds, smaller timing budgets, and heavier loads. Many designs are making the transition from 3.3 V to 2.5 V with bus speeds increasing beyond 100 MHz. Signal integrity need not be compromised to meet these design requirements. TI's AVC family is designed to meet the needs of these high-speed, low-voltage systems, including next-generation high-performance workstations, PCs, networking servers, and telecommunications switching equipment.

Key features:

- Sub-2-ns maximum t_{pd} at 2.5 V for AVC16245
- Designed for next-generation, high-performance PCs, workstations, and servers
- DOC circuitry enhances high-speed, low-noise operation
- Supports mixed-voltage systems
- Optimized for 2.5 V; operable from 1.2 V to 3.6 V
- Bus-hold feature eliminates need for external resistors on unused input pins.
- I_{off} supports partial power down.

See www.ti.com/sc/logic for the most current data sheets.

BCT
BiCMOS Technology Logic

BCT is a family of 8-, 9-, and 10-bit drivers, latches, transceivers, and registered transceivers. Designed specifically for bus-interface applications, BCT offers TTL I/O with high speeds, 64-mA output drive, and very low power in the disabled mode. Over 50 BCT functions are in production.

The BCT25xxx series of fast, high-drive bus-interface functions provides incident-wave switching required by large backplane applications. Designed specifically to ensure incident-wave switching down to 25 Ω, these low-impedance driver devices can maximize the speed and reliability of heavily loaded systems. Each device of this series delivers 188 mA of I_{OL} drive current.

Also included in TI's BCT family are devices with series damping resistors to reduce overshoot and undershoot that can occur in memory-driving applications.

See www.ti.com/sc/logic for the most current data sheets.

64BCT
64-Series BiCMOS Technology Logic

The 64BCT family offers all the features found in TI's standard BCT family. In addition, the family is characterized for operation from –40°C to 85°C and incorporates circuitry to protect the device in live-insertion applications.

See www.ti.com/sc/logic for the most current data sheets.

BTA
Bus-Termination Arrays

TI's BTA family offers a space-saving, efficient, and effective solution to bus-termination requirements. In high-speed digital systems with long transmission lines, reflecting waves on the line can cause voltage undershoots and overshoots that lead to malfunctions at the driven input. A BTA is a series of diodes that clamps a signal on a bus or any other signal trace using high-frequency logic to limit overshoot and undershoot problems.

See www.ti.com/sc/logic for the most current data sheets.

CBT
Crossbar Technology Logic

Power and speed are two primary concerns in today's computing market. CBT can address these issues in bus-interface applications. CBT enables a bus-interface device to function as a very fast bus switch, effectively isolating buses when the switch is open and offering very little propagation delay when the switch is closed. These devices can function as high-speed bus interfaces between computer-system components, such as the central processing unit (CPU) and memory. CBT devices also can be used as 5-V to 3.3-V translators, allowing designers to mix 5-V or 3.3-V components in the same system.

The CBT devices are available in advanced packaging, such as the shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), and thin very small-outline package (TVSOP) for reduced board area.

See www.ti.com/sc/logic for the most current data sheets.

CBTLV
Low-Voltage Crossbar Technology Logic

TI developed the SN74CBTLV family of 3.3-V bus switches to complement its existing SN74CBT family of 5-V bus switches. TI was the first to offer these devices, designed for 3.3-V, in its continuing drive to provide low-voltage solutions.

CBTLV devices can be used in multiprocessor systems as fast bus connections, bus-exchange switches for crossbar systems, ping-pong memory connections, or bus-byte swapping. They also can be used to replace relays, improving connect/disconnect speed and eliminating relay-reliability problems. The CBTLV family, designed to operate at 3.3 V, furthers the goal of an integrated system operating with LVTTL voltages.

The CBTLV devices are available in industry-leading packaging options, such as the shrink small-outline package (SSOP), thin small-outline package (TSSOP), and thin very small-outline package (TVSOP) for reduced board area.

See www.ti.com/sc/logic for the most current data sheets.

CD4000
CMOS B-Series Integrated Circuits

The CD4000 family is a CMOS B series of devices with a maximum dc supply-voltage rating of 20 V. The family has a large number of functions, including analog switches, monostable multivibrators, level converters, counters, timers, display drivers, phase-locked loops (PLLs), and other functions. The wide operating voltage range of this family allows use of the CD4000 products in varied applications, including instrumentation, control, and communications.

Key features:

- Wide variety of functions
- High noise immunity
- Low power consumption
- Propagation delay time similar to LSTTL products
- 5-, 10-, and 15-V parametric ratings
- High fanout, typically 10
- Excellent temperature stability

TI's CD4000 products were acquired from Harris Semiconductor in December 1998.

See www.ti.com/sc/logic for the most current data sheets.

74F
Fast Logic

74F logic is a general-purpose family of high-speed advanced bipolar logic. TI provides over 50 functions in the 74F family, including gates, buffers/drivers, bus transceivers, flip-flops, latches, counters, multiplexers, and demultiplexers.

See www.ti.com/sc/logic for the most current data sheets.

FB+/BTL
FutureBus+/ Backplane Transceiver Logic

The FB+ series of devices is designed for use in double-terminated high-speed bus applications and is fully compatible with IEEE Std 896-1991 (FutureBus+) and IEEE Std 1194.1-1991 (BTL). These transceivers are available in 7-, 8-, 9-, and 18-bit versions for 5-V CMOS or TTL-to-BTL and BTL-to-TTL translations. Other features include BTL drive up to 100 mA, low (5 pF to 6 pF maximum) B-port C_{io}, t_{pd} performance below 5 ns, and B-port BIAS V_{CC} pins for live insertion.

One device, the 18-bit 'FB1653, offers 5-V CMOS, TTL- or LVTTL-to-BTL and BTL-to-LVTTL translations.

See www.ti.com/sc/logic for the most current data sheets.

FCT
Fast CMOS TTL Logic

The FCT product family is designed for high-current-drive bus-interface applications. The FCT family is fabricated using a CMOS 6-µm technology to provide up to 40-mA or 64-mA current sink capability, with typical propagation delays of 5 ns (CD74FCT245). The family is optimized to operate at 5 V and is pin-function compatible with most standard bipolar and CMOS logic families.

The FCT family of devices has several features for efficient bus interfacing. The family does not have input or output diodes to V_{CC}, and most FCT devices have 3-state outputs. Bus noise is minimized with 1-V, or less, typical ground bounce (V_{olp}, 5-V V_{CC}, 25°C) and limited output voltage swing (3.5-V typical).

The FCT family includes 8-, 9-, and 10-bit bus-interface devices.

Key features:

- 5-V operation
- 5-ns typical propagation delay (CD74FCT245)
- Low quiescent power consumption
- 1-V typical V_{olp}

TI's FCT family was acquired from Harris Semiconductor in December 1998.

See www.ti.com/sc/logic for the most current data sheets.

FIFO
First-In, First-Out Memories

Today's competitive environment creates a constant need for greater system performance. One common method to optimize system performance involves the use of a first in, first out (FIFO) memory to eliminate the data bottlenecks common between digital signal processors (DSPs), high-speed processors, industry-standard buses, memory devices, and analog front ends (AFEs). TI offers a wide range of FIFO devices designed for use in a variety of systems including real-time DSP applications, telecommunications, internetworking, instrumentation, and high-bandwidth computing. TI's high-performance FIFO products provide the speed and features necessary to enhance your system's performance.

Visit the TI FIFO home page at http://www.ti.com/sc/fifo for a comprehensive overview of TI's FIFO product line, new product releases, data sheets, application reports, and pricing.

GTL
Gunning Transceiver Logic

GTL devices are high-speed transceivers operating at LVTTL logic levels on the card and at GTL/GTL+ signal levels on the bus. The devices are designed with faster edge rates for applications in which the backplane length/number of slots is limited, and hot insertion is not a requirement. GTL devices are best suited for use in point-to-point applications or in lightly loaded backplanes. The devices operate at the JEDEC JESD8-3 GTL or at the higher threshold-voltage/lower noise-margin GTL+ signal levels. Use GTLP devices in applications that require a slower edge rate, as in 21-slot backplanes.

GTL family features:

- 3.3-V or 3.3-/5-V V_{CC} operation with 5-V-tolerant LVTTL I/Os (except 'GTL1655) permits the devices to act as 5-V CMOS/TTL or 3.3-V LVTTL-to-GTL+/GTL and GTL+/GTL-to-3.3-V LVTTL translators.
- Output edge control (OEC™) reduces line reflections, electromagnetic interference (EMI), and improves overall signal integrity.
- B-port drive of 50 mA and 100 mA ('GTL1655 only) allows the designer flexibility in matching the device to the application.
- I_{off} circuitry prevents damage during partial power-down situations.
- Power-up 3-state (PU3S) and BIAS V_{CC} circuitry ('GTL1655 only) permit true live-insertion capability.
- Bus-hold circuitry (A port only) eliminates floating inputs by holding them at the last valid logic state. No external pullup or pulldown resistors are needed for unused or undriven inputs, which reduces power, cost, and board layout time. There is no bus-hold circuitry on the B port (GTL/GTL+ side) because this would defeat the purpose of the open-drain output that takes on the high-impedance state to allow the bus to be pulled to the logic high state via the termination resistors.

See http://www.ti.com/sc/gtl for further information. TI provides a wide range of design assistance, including application support, application reports, free samples, demonstration backplane, and HSPICE/IBIS simulation models.

GTLP
Gunning Transceiver Logic Plus

GTLP devices are high-speed CMOS transceivers specifically designed for heavily loaded parallel backplane applications. The reduced output swing (<1 V), reduced input threshold levels, differential input, and output edge control OEC™ and TI-OPC™ overshoot protection circuitry on the GTLP rising and falling edges reduces EMI and improves overall signal integrity, allowing higher backplane clock frequencies. This increases the bandwidth for manufacturers developing improved data-communication solutions.

GTLP solves high-performance parallel backplane designers' needs:

- Offers higher backplane speeds (60 MHz to 160 MHz) for increased data-throughput requirements, lower EMI, and lower power consumption.
- I_{off}, power-up 3-state (PU3S), and BIAS V_{CC} circuitry support true live-insertion capability for easy internal precharging of the backplane I/O pins for applications in which active backplane data cannot be suspended or disturbed during card insertion or removal.
- Compatible with existing parallel backplane technologies, GTLP provides an alternative to more complex serial technologies.

GTLP family features:

- 3.3-V V_{CC} with 5-V-tolerant LVTTL I/Os permits GTLP devices to act as 5-V CMOS, TTL, or LVTTL-to-GTLP and GTLP-to-LVTTL or TTL translators.
- A-port (LVTTL side) balanced drive of ±24 mA
- B-port (GTLP side) open drain sinks either 50 mA or 100 mA of current, allowing the designer flexibility in matching the best device to backplane length, slot spacing, and termination resistance.
- Edge-rate control (ERC) circuitry allows either fast or slow edge rates.
- One-third the static power consumption of BiCMOS logic devices
- A-port bus-hold circuitry (GTLPH only) eliminates floating inputs by holding them at the last valid logic state.

See http://www.ti.com/sc/gtlp for further information. TI provides a wide range of design assistance, including application reports and support, free samples, demonstration backplane, and HSPICE/IBIS simulation models.

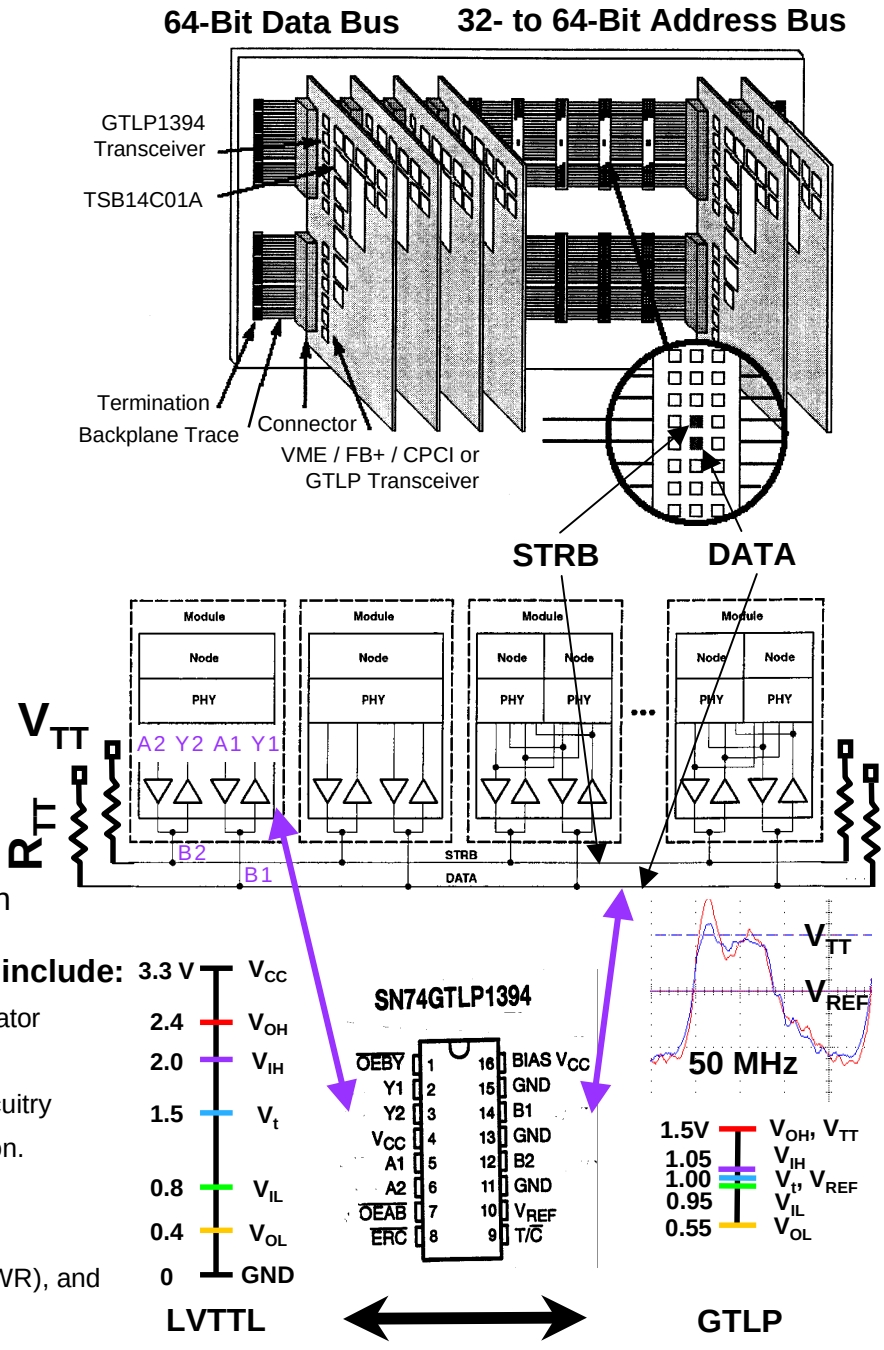
SN74GTLP1394

Specifically designed for use with the Texas Instruments TSB14C01A 1394 backplane layer controller family to transmit 1394 backplane serial bus across parallel backplanes

- The 1394 backplane serial bus plays a supportive role in backplane systems, providing a means for diagnostics, system enhancement, and peripheral monitoring.
- High-performance, multi-slot, parallel-backplane-optimized GTLP edge rates easily support data transfer rates of 25 Mbps (S25), 50 Mbps (S50), and 100 Mbps (S100).
- GTLP vs LVDS solutions
  - Single-chip solution
  - Easier to implement
- GTLP vs BTL/FB+ solutions
  - Better signal integrity
  - More cost effective
  - Less power consumption



SN74GTLP1394 main features include:

- LVTTL to GTLP bidirectional translator
- High GTLP drive (100 mA)
- TI-OPC™ overshoot protection circuitry
- BIAS V_{CC} supports true live insertion.
- 3.3-V V_{CC} with 5-V tolerance
- $3.75 in lots of 1000
- 16-pin SOIC (D & DR), TSSOP (PWR), and TVSOP (DGVR) packages

HC/HCT
High-Speed CMOS Logic

TI offers a full family of HC/HCT devices for low-power, medium- to low-speed applications. The recent addition of products acquired from Harris Semiconductor has added a wide range of additional functions. Over 250 HC and HCT device types are available, including gates, latches, flip-flops, buffers/drivers, counters, multiplexers, transceivers, and registered transceivers. The HC/HCT family is a popular, reliable logic family with 6-mA output current drive at 5-V V_{CC} (HC/HCT) and 20-μA output current drive 3.3-V V_{CC} (HC only).

While HCMOS can be used in most new designs, TI recommends Advanced High-Speed CMOS (AHC) as a reliable and effortless migration path from the HC family. AHC delivers the same low noise as HC, with half the static power consumption of HC, at a competitive price.

The HC family offers CMOS inputs and outputs, while the HCT family offers TTL inputs with CMOS outputs.

See www.ti.com/sc/logic for the most current data sheets.

commercial package description and availability

LFBGA (low-profile fine-pitch ball grid array)
GKE = 96 pins
GKF = 114 pins

VFBGA (very-thin-profile fine-pitch ball grid array)
GQL = 56 pins (also includes 48-pin functions)

PDIP (plastic dual-in-line package)
P = 8 pins
N = 14/16/20 pins
NT = 24/28 pins

PLCC (plastic leaded chip carrier)
FN = 20/28/44/68/84 pins

QFP (quad flatpack)
RC = 52 pins (FB only)
PH = 80 pins (FIFO only)
PQ = 100/132 pins (FIFO only)

TQFP (plastic thin quad flatpack)
PAH = 52 pins
PAG = 64 pins (FB only)
PM = 64 pins
PN = 80 pins
PCA, PZ = 100 pins (FB only)
PCB = 120 pins (FIFO only)

SOIC (small-outline integrated circuit)
D = 8/14/16 pins
DW = 16/20/24/28 pins

QSOP (quarter-size outline package)
DBQ = 16/20/24 pins

SSOP (shrink small-outline package)
DB = 14/16/20/24/28/30/38 pins
DBQ = 16/20/24
DL = 28/48/56 pins

TSSOP (thin shrink small-outline package)
PW = 8/14/16/20/24/28 pins
DGG = 48/56/64 pins

TVSOP (thin very small-outline package)
DGV = 14/16/20/24/48/56 pins
DBB = 80 pins

SOT (small-outline transistor)
DBV = 5 pins
DCK = 5 pins

schedule

✔ = Now ✣ = Planned

See Appendix A for package information on CD54/74HCT devices.

IEEE Std 1149.1 (JTAG) Boundary-Scan Logic

The IEEE Std 1149.1 (JTAG) boundary-scan logic family of octal, Widebus™, and scan-support functions incorporates circuitry that allows these devices and the electronic systems in which they are used to be tested without reliance on traditional probing techniques.

Bus-interface logic devices are available in BCT, ABT, and LVT technologies in 8-, 18-, and 20-bit options of the standard buffers, latches, and transceivers. The universal bus transceiver (UBT™), which can functionally replace 50+ standard bus-interface devices, is featured at Widebus widths (18 bits and 20 bits). Package options for these devices include plastic dual in-line package (PDIP), small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), and thin quad flatpack (TQFP). The scan-support functions include devices for controlling the test bus, performing at-speed functional testing, and partitioning the scan path into smaller, more manageable segments.

Over 40 devices, composed of a wide selection of BCT and ABT octals, ABT and LVT Widebus, and scan-support functions, are available. Bus-hold and series-damping-resistor features also are available.

See www.ti.com/sc/jtag for the most current data sheets.

Little Logic

TI's little-logic products are sized to meet smaller packaging needs in today's products. Designers needing to simplify board layout and routing can use little logic to aid in their design and cost-reduction efforts. With continued miniaturization of portable electronics, this product is the ideal choice for applications in which board area is limited.

Additionally, little-logic devices can be used to minimize the impact of ASIC design-error fixes by limiting the need for board redesign, enabling faster time to market and reduced costs.

Little-logic products are offered in the following technology families:

- LVC (low-voltage CMOS technology logic) with 1.65-V to 5-V V_{CC} operation and I_{off} circuitry
- AHC/AHCT (advanced high-speed CMOS logic) with 2-V to 5.5-V operation in CMOS- and TTL-compatible versions
- CBT/CBTD (crossbar technology logic) with 4.5-V to 5.5-V operation with output voltage translation with integrated level-shifting diode
- CBTLV (1G125)

Single gates are available in SOT 23-5 and SC-70 packages. Dual gates will be offered in SM-8 and US-8 packages.

See www.ti.com/sc/logic for the most current data sheets.

LS
Low-Power Schottky Logic

With a wide array of functions, TI's LS family continues to offer replacement alternatives for mature systems. This classic line of devices was at the cutting edge of performance when introduced, and it continues to deliver excellent value for many of today's designs. As the world leader in logic products, TI is committed to being the last major supplier at every price-performance node.

See www.ti.com/sc/logic for the most current data sheets.

LV
Low-Voltage CMOS Technology Logic

TI's entire LV family has been redesigned for better flexibility in your 3.3-V or 5-V system. New LV-A devices (e.g., 'LV00A, 'LV02A) have improved operating characteristics and new features, such as 5-V tolerance, faster performance, and partial power down.

The LV-A series of devices has expanded its voltage operation range (2-V to 5.5-V V_{CC}), while still having a static power consumption of only 20 μA for both bus-interface and gate functions. The LV family now has propagation delays of 5.4 ns typical at 3.3 V (SN74LV244A) and provides 8 mA of current drive. With an I_{off} specification of only 5 μA, these devices have the capability of partially powering down. In addition, the typical output V_{OH} undershoot (V_{OHV}) has been improved to >2.3 V at 3.3-V V_{CC} for quieter operation.

New key features:

- Support mixed-mode voltage operation on all ports
- I_{off} for partial power down
- 14 ns maximum at 3.3-V V_{CC} for buffers

The LV family is offered in the octal footprints with advanced packaging, such as small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), and thin shrink small-outline package (TSSOP).

See www.ti.com/sc/logic for the most current data sheets.

LVC
Low-Voltage CMOS Technology Logic

TI's LVC products are specially designed for 3-V power supplies.

The LVC family is a high-performance version with 0.8-μ CMOS process technology, 24-mA current drive, and 6.5-ns maximum propagation delays for driver operations. The LVC family includes both bus-interface and gate functions, with 60 different functions planned.

The LVC family is offered in the octal and Widebus™ footprints, with all of the advanced packaging such as small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), very small-outline package (TVSOP), and selected devices in MicroStar BGA™ (LFBGA) packages.

All LVC devices are available with 5-V tolerant inputs and outputs.

An extensive line of single gates is planned in the LVC family.

See www.ti.com/sc/logic for the most current data sheets.

LVT
Low-Voltage BiCMOS Technology Logic

LVT is a 5-V tolerant, 3.3-V product using the latest 0.72-μ BiCMOS technology with performance specifications ideal for workstation, networking, and telecommunications applications. LVT delivers 3.5-ns propagation delays at 3.3 V (28% faster than ABT at 5 V), current drive of 64 mA, and pin-for-pin compatibility with existing ABT families.

LVT operates at LVTTL signal levels in telecom and networking high-performance system point-to-point or distributed backplane applications. LVT is an excellent migration path from ABT.

In addition to popular octal and Widebus™ bus-interface devices, TI also offers the universal bus transceiver (UBT™) and selected functions in Widebus+™ in this low-voltage family.

Performance characteristics of the LVT family are:

- 3.3-V operation with 5-V tolerant I/Os – Permits use in a mixed-voltage environment.
- Speed – Provides high-performance with maximum propagation delays of 3.5 ns at 3.3 V for buffers.
- Drive – Provides up to 64 mA of drive at 3.3-V V_{CC}, yet consumes less than 330 μW of standby power.

Additional features include:

- Live insertion – LVT devices incorporate I_{off} and power-up 3-state (PU3S) circuitry to protect the devices in live-insertion applications and make them ideally suited for hot-insertion applications. I_{off} prevents the devices from being damaged during partial power down, and PU3S forces the outputs to the high-impedance state during power up and power down.
- Bus hold – Eliminates floating inputs by holding them at the last valid logic state. This eliminates the need for external pullup and pulldown resistors.
- Damping-resistor option – TI implements series damping resistors on selected devices, which not only reduces overshoot and undershoot, but also matches the line impedance, minimizing ringing.
- Packaging – LVT devices are available in small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), thin very small-outline package (TVSOP) (select devices), and selected devices in MicroStar BGA™ (LFBGA) package.

See www.ti.com/sc/logic for the most current data sheets.

PCA
I²C Inter-Integrated Circuit Applications

The I²C bus is a bidirectional two-wire bus for communicating between integrated circuits. The PCA and future PCF devices offered by TI are general-purpose logic to be used with the I²C or system management (SM) bus protocols.

SSTL/SSTV
Stub Series-Terminated Logic

The SSTL interface is the computer industry's leading choice for next-generation technology in high-speed memory subsystems, adopted by JESD8-8 and JESD8-9 and endorsed by major memory-module, workstation, and PC manufacturers.

TI's SSTL family is optimized for 3.3-V V_{CC} operation. The SSTV family is optimized for 2.5-V V_{CC} operation. The devices offered in the SSTL/SSTV families are ideal solutions for address/control bus buffering in high-performance double-data-rate (DDR) memory systems.

HSTL
High-Speed Transceiver Logic

One of TI's low-voltage interface solutions is HSTL. HSTL devices accept a minimal differential input swing from 0.65 V to 0.85 V (nominally) with the outputs driving LVTTL levels. HSTL is ideally suited for driving an address bus to two banks of memory. The HSTL input levels follow JESD8-6.

See www.ti.com/sc/logic for the most current data sheets.

TVC
Translation Voltage Clamp Logic

TVC products are designed to protect components sensitive to high-state voltage-level overshoots.

New designs for PCs and other bus-oriented products require faster and lower-power devices built with advanced submicron semiconductor processes. Often, the I/Os of these devices are intolerant of high-state voltage levels on the communication buses used. The need for I/O protection became apparent for devices communicating with legacy buses, and the TVC family fills this need.

TVC devices offer an array of n-type metal-oxide semiconductor (NMOS) field-effect transistors (FETs) with the gates cascaded to a common gate input. TVC devices can be used as voltage limiters by connecting one of the FETs as a voltage reference transistor and the remainder as pass transistors. The low-voltage side of each pass transistor is limited to the voltage set by the reference transistor. All of the FETs in the array have essentially the same characteristics, so any one can be used as the reference transistor. Because the fabrication of the FETs is symmetrical, either port connection for each bit can be used as the low-voltage side, and the I/O signals are bidirectional through each FET.

Key features:

- No logic supply voltage required (no internal control logic)
- Used as voltage translators or voltage clamps
- 7-Ω on-state resistance with gate at 3.3 V
- Any FET can be used as the reference transistor.
- Direct interface with GTL+ levels
- Accept any I/O voltage from 0 to 5.5 V
- Flow-through pinout for ease of printed circuit board layout
- Minimum fabrication process transistor characteristic variations

See www.ti.com/sc/logic for the most current data sheets.

commercial package description and availability

LFBGA (low-profile fine-pitch ball grid array)
GKE = 96 pins
GKF = 114 pins

VFBGA (very-thin-profile fine-pitch ball grid array)
GQL = 56 pins (also includes 48-pin functions)

PDIP (plastic dual-in-line package)
P = 8 pins
N = 14/16/20 pins
NT = 24/28 pins

PLCC (plastic leaded chip carrier)
FN = 20/28/44/68/84 pins

QFP (quad flatpack)
RC = 52 pins (FB only)
PH = 80 pins (FIFO only)
PQ = 100/132 pins (FIFO only)

TQFP (plastic thin quad flatpack)
PAH = 52 pins
PAG = 64 pins (FB only)
PM = 64 pins
PN = 80 pins
PCA, PZ = 100 pins (FB only)
PCB = 120 pins (FIFO only)

SOIC (small-outline integrated circuit)
D = 8/14/16 pins
DW = 16/20/24/28 pins

QSOP (quarter-size outline package)
DBQ = 16/20/24 pins

SSOP (shrink small-outline package)
DB = 14/16/20/24/28/30/38 pins
DBQ = 16/20/24
DL = 28/48/56 pins

TSSOP (thin shrink small-outline package)
PW = 8/14/16/20/24/28 pins
DGG = 48/56/64 pins

TVSOP (thin very small-outline package)
DGV = 14/16/20/24/48/56 pins
DBB = 80 pins

SOT (small-outline transistor)
DBV = 5 pins
DCK = 5 pins

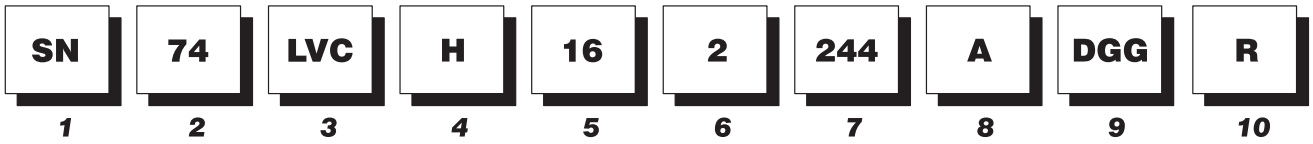
PACKAGING AND SYMBOLIZATION INFORMATION

A

APPENDIX A
PACKAGING AND SYMBOLIZATION INFORMATION

CONTENTS

Example:



1 Standard Prefix

Examples: SN – Standard Prefix
SNJ – Conforms to MIL-PRF-38535 (QML)

2 Temperature Range

Examples: 54 – Military
74 – Commercial

3 Family

Examples: Blank – Transistor-Transistor Logic
ABT – Advanced BiCMOS Technology
ABTE/ETL – Advanced BiCMOS Technology/ Enhanced Transceiver Logic
AC/ACT – Advanced CMOS Logic
AHC/AHCT – Advanced High-Speed CMOS Logic
ALB – Advanced Low-Voltage BiCMOS
ALS – Advanced Low-Power Schottky Logic
ALVC – Advanced Low-Voltage CMOS Technology
AS – Advanced Schottky Logic
AVC – Advanced Very Low-Voltage CMOS Logic
BCT – BiCMOS Bus-Interface Technology
CBT – Crossbar Technology
CBTLV – Low-Voltage Crossbar Technology
CD4000 – CMOS B-Series Integrated Circuits
F – F Logic
FB – Backplane Transceiver Logic/Futurebus+
FCT – Fast CMOS TTL Logic
GTL – Gunning Transceiver Logic
HC/HCT – High-Speed CMOS Logic
HSTL – High-Speed Transceiver Logic
LS – Low-Power Schottky Logic
LV – Low-Voltage CMOS Technology
LVC – Low-Voltage CMOS Technology
LVT – Low-Voltage BiCMOS Technology
PCA – I^2C Inter-Integrated Circuit Applications
S – Schottky Logic
SSTL/SSTV – Stub Series-Terminated Logic
TVC – Translation Voltage Clamp Logic

4 Special Features

Examples: Blank = No Special Features
C – Configurable V_{CC} (LVCC)
D – Level-Shifting Diode (CBTD)
H – Bus Hold (ALVCH)
K – Undershoot-Protection Circuitry (CBTK)
R – Damping Resistor on Inputs/Outputs (LVCR)
S – Schottky Clamping Diode (CBTS)
Z – Power-Up 3-State (LVCZ)

5 Bit Width

Examples: Blank = Gates, MSI, and Octals
1G – Single Gate
8 – Octal IEEE 1149.1 (JTAG)
16 – Widebus™ (16, 18, and 20 bit)
18 – Widebus IEEE 1149.1 (JTAG)
32 – Widebus+™ (32 and 36 bit)

6 Options

Examples: Blank = No Options
2 – Series Damping Resistor on Outputs
4 – Level Shifter
25 – 25-Ω Line Driver

7 Function

Examples: 244 – Noninverting Buffer/Driver
374 – D-Type Flip-Flop
573 – D-Type Transparent Latch
640 – Inverting Transceiver

8 Device Revision

Examples: Blank = No Revision
Letter Designator A–Z

9 Packages

Commercial: D, DW – Small-Outline Integrated Circuit (SOIC)
DB, DL – Shrink Small-Outline Package (SSOP)
DBB, DGV – Thin Very Small-Outline Package (TVSOP)
DBQ – Quarter-Size Outline Package (QSOP)
DBV, DCK – Small-Outline Transistor Package (SOT)
DGG, PW – Thin Shrink Small-Outline Package (TSSOP)
FN – Plastic Leaded Chip Carrier (PLCC)
GKE, GKF – MicroStar BGA™ Low-Profile Fine-Pitch Ball Grid Array (LFBGA)
GQL – MicroStar Junior BGA Very-Thin-Profile Fine-Pitch Ball Grid Array (VFBGA)
N, NP, NT – Plastic Dual-In-Line Package (PDIP)
NS, PS – Small-Outline Package (SOP)
PAG, PAH, PCA, PCB, PM, PN, PZ – Thin Quad Flatpack (TQFP)
PH, PQ, RC – Quad Flatpack (QFP)

Military: FK – Leadless Ceramic Chip Carrier (LCCC)
GB – Ceramic Pin Grid Array (CPGA)
HFP, HS, HT, HV – Ceramic Quad Flatpack (CQFP)
J, JT – Ceramic Dual-In-Line Package (CDIP)
W, WA, WD – Ceramic Flatpack (CFP)

10 Tape and Reel

Devices in the DB and PW package types include the R designation for reeled product. Existing product inventory designated LE may remain, but all products are being converted to the R designation.

Examples: Old Nomenclature – SN74LVTxxxDBLE
New Nomenclature – SN74LVTxxxADBR

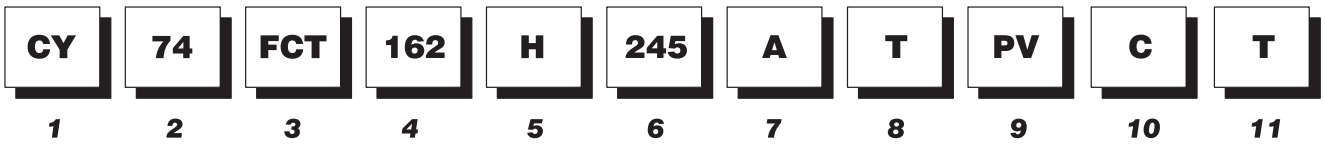
LE – Left Embossed (valid for DB and PW packages only)
R – Standard (valid for all surface-mount packages)

There is no functional difference between LE and R designated products, with respect to the carrier tape, cover tape, or reels used.

DEVICE NAMES AND PACKAGE DESIGNATORS FOR LOGIC PRODUCTS FORMERLY OFFERED BY CYPRESS SEMICONDUCTOR

CYFCT Nomenclature

Example:



1 Prefix Designation for Acquired Cypress FCT Logic

May be blank to accommodate 18-character limitation

2 Temperature Range

Examples: 54 – Military (–55°C to 125°C)
74 – Commercial/Industrial (–40°C to 85°C)
29 – Commercial/Industrial or Military (see data sheet)

3 Family

Example: FCT – FAST™ CMOS TTL Logic

4 16 or Greater Bit Width With Balanced Drive or 3.3-V Operation

Examples: Blank
16x – 16 or Greater Bit Width With Balanced Drive or 3.3-V Operation
162 – Balanced Drive (series output resistors)
163 – 3.3 V

5 Bus Hold

Examples: Blank = No Bus Hold
H – Bus Hold (present only when preceded by 16x – see item 4)

6 Type Designation

Up to Five Digits
Examples: 245
1652
16245

7 Speed Grade

Examples: Blank = No Speed Grade
A
B
C
D
E

8 TTL or CMOS Outputs

Examples: Blank = CMOS Outputs
T – TTL Outputs

9 Packages

Examples: P – Plastic Dual-In-Line Package (PDIP) (N)
PA – Thin Shrink Small-Outline Package (TSSOP) (DGG/G)
PV – Shrink Small-Outline Package (SSOP) (DL)
Q – Quarter-Size Outline Package (QSOP) (DBQ)
SO – Small-Outline Integrated Circuit (SOIC) (DL)

10 Processing

Example: C – Commercial Processing

11 Tape and Reel

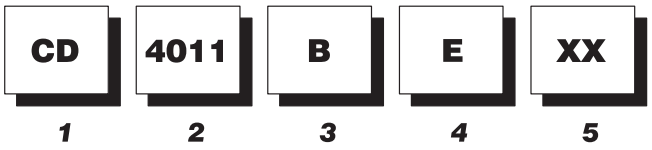
Example: T – Tape and Reel Packing

FAST is a trademark of Fairchild Semiconductor.

DEVICE NAMES AND PACKAGE DESIGNATORS FOR LOGIC PRODUCTS FORMERLY OFFERED BY HARRIS SEMICONDUCTOR

CD4000 Nomenclature

Example



1 Prefix Designation for Acquired Harris Digital Logic

2 Type Designation

Up to Five Digits

3 Supply Voltage

Examples: A – 12 V Maximum
B – 18 V Maximum
UB – 18 V Maximum, Unbuffered

4 Packages

Examples: D – Ceramic Side-Brazed Dual-In-Line Package (DIP)
E – Plastic DIP
F – Ceramic DIP
K – Ceramic Flatpack
M – Plastic Surface-Mount Small-Outline Integrated Circuit (SOIC)
SM – Plastic Shrink SOIC (SSOP)
M96 – Reeled Plastic Surface-Mount SOIC
SM96 – Reeled Plastic Shrink SOIC (SSOP)

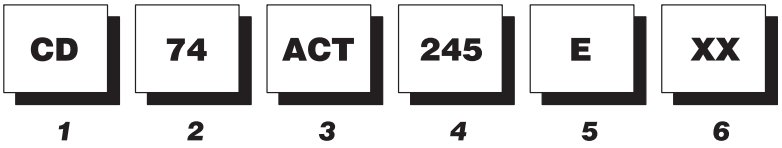
5 High-Reliability Screening

Military Products Only

Examples: 3 – Noncompliant With MIL-STD-883, Class B
3A – Fully Compliant With MIL-STD-883, Class B

CDAC/CDACT Advanced CMOS and CDHC/CDHCT/CDHCU High-Speed CMOS Nomenclature

Example



1 Prefix Designation for Acquired Harris Digital Logic

2 Temperature Range

Examples: 54 – Military (–55°C to 125°C)
74 – Commercial (0°C to 70°C)

3 Family

Examples: AC – Advanced CMOS Logic, CMOS Input Levels
ACT – Advanced CMOS Logic, TTL Input Levels
HC – High-Speed CMOS Logic, CMOS Input Levels
HCT – High-Speed CMOS Logic, TTL Input Levels
HCU – High-Speed CMOS Logic, CMOS Input Levels, Unbuffered

4 Type Designation

Up to Five Digits

5 Packages

Examples: E – Plastic Dual-In-Line Package (DIP)
EN – Plastic Slim-Line 24-Lead DIP
F – Ceramic DIP
M – Plastic Surface-Mount Small-Outline Integrated Circuit (SOIC)
SM – Plastic Shrink SOIC (SSOP)
M96 – Reeled Plastic Surface-Mount SOIC
SM96 – Reeled Plastic Shrink SOIC (SSOP)

6 High-Reliability Screening

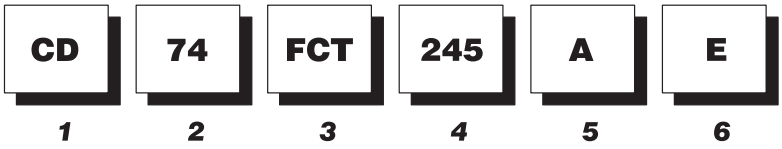
Military Products Only

Example: 3A – Fully Compliant With MIL-STD-883

DEVICE NAMES AND PACKAGE DESIGNATORS FOR LOGIC PRODUCTS FORMERLY OFFERED BY HARRIS SEMICONDUCTOR

CDFCT Nomenclature

Example



1 Prefix Designation for Acquired Harris Digital Logic

2 Temperature Range

Examples: 54 – Military (–55°C to 125°C)
74 – Commercial (0°C to 70°C)

3 Family

Example: FCT – Bus Interface, TTL Input Levels

4 Type Designation

Up to Five Digits

5 Speed Grade

Example: Blank or A – Standard Equivalent to FAST™

6 Packages

Examples: E – Plastic Dual-In-Line Package (DIP)
EN – Plastic Slim-Line 24-Lead DIP
F – Ceramic DIP
M – Plastic Surface-Mount Small-Outline Integrated Circuit (SOIC)
SM – Plastic Shrink SOIC (SSOP)
M96 – Reeled Plastic Surface-Mount SOIC
SM96 – Reeled Plastic Shrink SOIC (SSOP)

FAST is a trademark of Fairchild Semiconductor.

In the past, logic products had the complete device name on the package. It has become necessary to reduce the character count, as package types have become smaller and logic names longer. Information in the following tables is intended to help interpret TI's logic symbolization.

Table A-1 defines a "name rule" (A, B, or C) based on the type of package for a specific device. Each name rule differs in the number of characters that are symbolized on the package. Name rule A uses the complete, or fully qualified, device name. Name rules B and C include fewer characters, respectively. Table A-2 is a listing of the various logic products by name rule.

Example: Assume a 48-pin TVSOP with the symbolization VH***. Locate the 48-pin TVSOP (DGV) package in Table A-1, and find the name rule used (C). Proceed to Table A-2, and find VH*** in the *Name Rule C* column. The most complete device number, SN74ALVCH16***, is located in the *Name Rule A* column.

See the following information and Tables A-3 and A-4 for little-logic (PicoGate Logic and Microgate Logic) packages.

Table A-1. Name Rule Decision Tree

PACKAGE	NO. PINS	NAME RULE	PACKAGE DESIGNATOR

DCK and DBV 5-Pin SOT Packages

The DCK (PicoGate Logic) and DBV (Microgate Logic) 5-pin packages are very small and have space for only three or four symbolization characters. The format of the characters is 1, 2, 4, or 1, 2, 3, 4 where:

PACKAGE	DCK	DBV	TABLE
Device technology	1	1	See Table A-3
Device function	2	2, 3	See Table A-4
Wafer fabrication/assembly test site code	3	4	

Tables A-3 and A-4 list the possible device technology and function codes for the 5-pin packages. In some cases, the tables may list a device technology or function that is not yet available. The wafer fabrication and assembly-test site is coded into the final character for both packages. Additional tracking information is coded into “dots” or marks adjacent to the device pins. For further information about a specific device, please contact your local field sales office or the TI Product Information Center.

PicoGate Logic

PicoGate Logic uses a three-character name rule. The first character denotes the technology family, the second character denotes device function, and the third character denotes a wafer fabrication and assembly-test facility combination (for internal tracking, here denoted by x).

Example: A PicoGate Logic device with a package code of BAx is an SN74AHCT1G00DBV.

Microgate Logic

Microgate Logic uses a four-character name rule. The first character denotes the technology family, the second and third characters denote device function, and the fourth character denotes a wafer fabrication and assembly-test facility combination (for internal tracking, here denoted by x).

Example: A Microgate Logic device with a package code of A02x is an SN74AHC1G02DCK.

Table A-3. Device Technology Codes

TECHNOLOGY	CODE
AHC	A
AHCT	B
ALVC	G
CBT	S
CBTD	P
LVC1G**A	L
LVC1G**B	C
CBTLV1G	V

Table A-4. Device Function Codes

FUNCTION	DCK	DBV
00	A	00
02	B	02
04	C	04
05	5	05
06	T	06
07	V	07
08	E	08
125	M	25
126	N	26
132	Y	3B
14	F	14
157		57
240	K	40
241		41
245		45
32	G	32
79	R	79
80	X	80
86	H	86
4066	L	
U04	D	U4

Table A-5 lists the moisture sensitivity of TI packages by level. Some packages differ in level by pin count. Where no pin count is shown, all packages of that type used in the assembly of logic products have the same moisture-sensitivity level.

Table A-5. Package Moisture Sensitivity by Levels

PACKAGE	LEVEL 1	LEVEL 2	LEVEL 2A	LEVEL 3	LEVEL 4
PLCC	FN (20/28)			FN (44/68)	
SOT	DBV (5) DCK (5)				
SOP	NS (14/16/20) PS (8)				
SOIC	D (8/14/16) DW (16/20/24/28)				
SSOP	DB (14/16/20/24/28/30/38) DBQ (16/20/24) DL (28/48/56)				
TSSOP	DGG (48/56/64) PW (8/14/16/20/24)				
TVSOP	DBB (80) DGV (14/16/20/24/48/56)				
QFP		RC (52)			
TQFP		PAG (64) PCA (100) PN (80) PZ (100)			PM (64)
MicroStar BGA				GKE (96) GKF (114)	
MicroStar Junior BGA			GQL (56)		

NOTES: 1. No current device packages are moisture-sensitivity levels 5 or 6.
2. Some device types in these packages may have different moisture-sensitivity levels than shown.

TI's through-hole packages (N, NT) have not been tested per the JESD22-A112A/JESD22-A113A standards. Due to the nature of the through-hole PCB soldering process, the component package is shielded from the solder wave by the PC board and is not subjected to the higher reflow temperatures experienced by surface-mount components.

TI's through-hole component packages are classified as not moisture sensitive.

MOISTURE SENSITIVITY BY PACKAGE

The information in Table A-6 was derived using the test procedures in JESD22-A112A and JESD22-A113A. The *Floor Life* column lists the time that products can be exposed to the open air while in inventory or on the manufacturing floor. The worst-case environmental conditions are given. The *Soak Requirements* column lists the preconditioning, or soak, conditions used when testing to determine the floor-life exposure time.

Table A-6. Moisture-Sensitivity Levels (JESD22-A112A/JESD22-A113A)

LEVEL	FLOOR LIFE		SOAK REQUIREMENTS	
	CONDITIONS	TIME (hours)	CONDITIONS	TIME (hours)
1	≤ 30°C/90% RH	Unlimited	85°C/85% RH	168
2	≤ 30°C/60% RH	1 year	85°C/60% RH	168
2A	≤ 30°C/60% RH	4 weeks	30°C/60% RH	696
				X + Y = Z†
3	≤ 30°C/60% RH	168	30°C/60% RH	24 + 168 = 192
4	≤ 30°C/60% RH	72	30°C/60% RH	24 + 72 = 96
5	≤ 30°C/60% RH	24	30°C/60% RH	24 + 24 = 48
6	≤ 30°C/60% RH	6	30°C/60% RH	0 + 6 = 6

RH = Relative humidity

† X + Y = Z, where:

X = Default value of time between bake and bag. If the actual time exceeds this value, use the actual time and adjust the soak time (Z). For levels 3–6, X can be standardized at 24 hours as long as the actual time does not exceed this value.

Y = Floor life of package after it is removed from dry-pack bag

Z = Total soak time for the evaluation

For more information, see:

Packaging Material Standards for Moisture-Sensitive Items, EIA Std EIA-583

Symbol and Labels for Moisture-Sensitive Devices, EIA/JEDEC Engineering Publication EIA/JEP113-B, May 1999

Guidelines for the Packing, Handling, and Repacking of Moisture-Sensitive Components, EIA/JEDEC Publication EIA/JEP124, December 1995

Table A-7 is a packaging cross-reference for TI and other semiconductor manufacturing companies. If a specific alternate source agreement exists between TI and a particular company, the cell is shaded.

Tape and Reel¶		R#‖	96	T	X	R	T/R	X	T1, T3, T4, R1, R2, RL	X	–T	EL

† IDT has a TSSOP with similar specifications and lead pitch to TI's TVSOP package.
‡ Quality Semiconductor's QVSOP package has the same pitch but slightly different footprint than TI's TVSOP package.
§ Pericom has a QVSOP with similar specifications and lead pitch to TI's TVSOP package.
¶ Tape and reel packaging is valid for surface-mount packages only. All orders must be for whole reels.
# LE = Left-embossed tape and reel may be seen with some DB and PW packages, however, the nomenclature is transitioning to R.
‖ R = Standard tape and reel (required for DBB, DBV, and DGG; optional for D, DL, and DW packages)

Tables B-1 through B-4 list equivalent or similar product types for most logic families available in the industry, separated by voltage node and specialty logic. As the world leader in logic products, TI offers the broadest logic portfolio to meet your design needs.

Alternate sourcing agreements between TI and other companies are shown with shaded table cells. Crosshatched cells are used where the products are identical (or nearly identical). Cells with no background are used where the products are similar.

PRODUCT SUPPORT: TRAINING

SN74ALS373A, Octal D-Type Transparent Latches with 3-state Outputs

DEVICE STATUS: ACTIVE

PARAMETER NAME	SN74ALS373A
Voltage Nodes (V)	5

FEATURES

Back to Top

- Eight Latches in a Single Package
- 3-State Bus-Driving True Outputs
- Full Parallel Access for Loading
- Buffered Control Inputs
- pnp Inputs Reduce dc Loading on Data Lines
- Package Options Include Plastic Small-Outline (DW) Packages, Ceramic Chip Carriers (FK), and Standard Plastic (N) and Ceramic (J) 300-mil DIPs

DESCRIPTION

Back to Top

These octal transparent D-type latches feature 3-state outputs designed specifically for driving highly capacitive or relatively low-impedance loads. They are particularly suitable for implementing buffer registers, I/O ports, bidirectional bus drivers, and working registers.

While the latch-enable (LE) input is high, the Q outputs follow the data (D) inputs. When LE is taken low, the Q outputs are latched at the logic levels set up at the D inputs.

A buffered output-enable ($\overline{OE}$) input can be used to place the eight outputs in either a normal logic state (high or low) or a high-impedance state. In the high-impedance state, the outputs neither load nor drive the bus lines significantly. The high-impedance state and the increased drive provide the capability to drive bus lines without interface or pullup components.

$\overline{OE}$ does not affect internal operations of the latches. Old data can be retained or new data can be entered while the outputs are off.

The SN54ALS373 and SN54AS373 are characterized for operation over the full military temperature range of -55°C to 125°C. The SN74ALS373A and SN74AS373 are characterized for operation from 0°C to 70°C.
