- Access times: 55ns / 70ns (max.)
- Current:
  - Very low power version: Operating: 30mA (max.)
  - Standby: 10μA (max.)
- Full static operation, no clock or refreshing required
- All inputs and outputs are directly TTL-compatible
- Common I/O using three-state output
- Data retention voltage: 2V (min.)
- Available in 32-pin TSSOP 36-ball CSP package

### General Description

The LP62S4096E-I is a low operating current 4,194,304-bit static random access memory organized as 524,288 words by 8 bits and operates on a low power supply range: 2.7V to 3.3V. It is built using AMIC's high performance CMOS process.

Inputs and three-state outputs are TTL compatible and allow for direct interfacing with common system bus structures.

Two chip enable inputs are provided for POWER-DOWN and device enable and an output enable input is included for easy interfacing.

Data retention is guaranteed at a power supply voltage as low as 2V.

- CE2 pin for CSP package only

4. If the  $\overline{CE1}$  low or CE2 high transition occurs simultaneously with the  $\overline{WE}$  low transition or after the  $\overline{WE}$  transition, outputs remain in a high impedance state.

5.  $t_{cw}$  is measured from the later of  $\overline{CE1}$  going low or CE2 going high to the end of Write.

6.  $\overline{OE}$  level is high or low.
