

Document Title

512Kx36-bit, 1Mx18-bit, 2Mx8-bit DDRII CIO b2 SRAM

Revision History

<u>Rev. No.</u>	<u>History</u>	<u>Draft Date</u>	<u>Remark</u>
0.0	1. Initial document.	Oct. 23. 2002	Advance
0.1	1. Add the speed bin (-33, -30) 2. Delete the speed bin (-25, -13)	Oct. 24. 2002	Preliminary
0.2	1. Change the Boundary scan exit order. 2. Correct the Overshoot and Undershoot timing diagram.	Dec. 16, 2002	Preliminary

---

The attached data sheets are prepared and approved by SAMSUNG Electronics. SAMSUNG Electronics CO., LTD. reserve the right to change the specifications. SAMSUNG Electronics will evaluate and reply to your requests and questions on the parameters of this device. If you have any questions, please contact the SAMSUNG branch office near your office, call or contact Headquarters.

---

**512Kx36-bit, 1Mx18-bit, 2Mx8-bit DDRII CIO b2 SRAM**

**FEATURES**

- 1.8V±0.1V/-0.1V Power Supply.
- DLL circuitry for wide output data valid window and future frequency scaling.
- I/O Supply Voltage 1.5V±0.1V/-0.1V for 1.5V I/O, 1.8V±0.1V/-0.1V for 1.8V I/O.
- Pipelined, double-data rate operation.
- Common data input/output bus .
- HSTL I/O
- Full data coherency, providing most current data.
- Synchronous pipeline read with self timed late write.
- Registered address, control and data input/output.
- DDR(Double Data Rate) Interface on read and write ports.
- Fixed 2-bit burst for both read and write operation.
- Clock-stop supports to reduce current.
- Two input clocks(K and  $\bar{K}$ ) for accurate DDR timing at clock rising edges only.
- Two input clocks for output data(C and  $\bar{C}$ ) to minimize clock-skew and flight-time mismatches.
- Two echo clocks (CQ and  $\bar{CQ}$ ) to enhance output data traceability.
- Single address bus.
- Byte write (x18, x36) and nybble(x8) write function.
- Simple depth expansion with no data contention.
- Programmable output impedance.
- JTAG 1149.1 compatible test access port.
- 165FBGA(11x15 ball array FBGA) with body size of 13x15mm

Organization	Part Number	Cycle Time	Access Time	Unit
X36	K71163682B-FC33	3.0	0.45	ns
	K71163682B-FC30	3.3	0.45	ns
	K71163682B-FC20	5.0	0.45	ns
	K71163682B-FC16	6.0	0.50	ns
X18	K71163682B-FC33	3.0	0.45	ns
	K71163682B-FC30	3.3	0.45	ns
	K71163682B-FC16	6.0	0.50	ns
X8	K71163682B-FC33	3.0	0.45	ns
	K71163682B-FC30	3.3	0.45	ns
	K71163682B-FC20	5.0	0.45	ns
	K71163682B-FC16	6.0	0.50	ns

**FUNCTIONAL BLOCK DIAGRAM**

**Notes:** 1. Numbers in ( ) are for x18 device, x8 device also the same with appropriate adjustments of depth and width.

DDRII SRAM and Double Data Rate comprise a new family of products developed by Cypress, Hitachi, IDT, Micron, NEC and Samsung technology.

**512Kx36 & 1Mx18 & 2Mx8 DDRII CIO b2 SRAM**

Notes: 1. C,  $\overline{C}$ , K or  $\overline{K}$  cannot be set to VREF voltage.  
2. When ZQ pin is directly connected to VDD output impedance is set to minimum value and it cannot be connected to ground or left unconnected.  
3. Not connected to chip pad internally.  
4. The X8 product does not permit random start address on the least significant address bit.

## GENERAL DESCRIPTION

The K71163682B, K71161882B and K71160882B are 18,874,368-bits DDR Common I/O Synchronous Pipelined Burst SRAMs.

They are organized as 524,288 words by 36bits for K71163682B, 1,048,576 words by 18 bits for K71161882B and 2,097,152 words by 8bits for K71160882B.

Address, data inputs, and all control signals are synchronized to the input clock ( K or  $\overline{K}$  ).

Normally data outputs are synchronized to output clocks ( C and  $\overline{C}$  ), but when C and  $\overline{C}$  are tied high, the data outputs are synchronized to the input clocks ( K and  $\overline{K}$  ).

Read data are referenced to echo clock ( CQ or  $\overline{CQ}$  ) outputs.

Read address and write address are registered on rising edges of the input K clocks.

Common address bus is used to access address both for read and write operations.

The internal burst counter is fixed to 2-bit sequential for both read and write operations.

Synchronous pipeline read and late write enable high speed operations.

Simple depth expansion is accomplished by using  $\overline{LD}$  for port selection.

Byte write operation is supported with  $\overline{BW}_0$  and  $\overline{BW}_1$  (  $\overline{BW}_2$  and  $\overline{BW}_3$  ) pins for x18 ( x36 ) device.

Nybble write operation is supported with  $\overline{NW}_0$  and  $\overline{NW}_1$  pins for x8 device.

IEEE 1149.1 serial boundary scan (JTAG) simplifies monitoring package pads attachment status with system.

The K71163682B, K71161882B and K71160882B are implemented with SAMSUNG's high performance 6T CMOS technology and is available in 165pin FBGA packages. Multiple power and ground pins minimize ground bounce.

## Read Operations

Read cycles are initiated by initiating  $\overline{RW}$  as high at the rising edge of the positive input clock K.

Address is presented and stored in the read address register synchronized with K clock.

For 2-bit burst DDR operation, it will access two 36-bit, 18-bit or 8-bit data words with each read command.

The first pipelined data is transferred out of the device triggered by  $\overline{C}$  clock following next  $\overline{K}$  clock rising edge.

Next burst data is triggered by the rising edge of following C clock rising edge.

Continuous read operations are initiated with K clock rising edge.

And pipelined data are transferred out of device on every rising edge of both C and  $\overline{C}$  clocks.

In case C and  $\overline{C}$  tied to high, output data are triggered by K and  $\overline{K}$  instead of C and  $\overline{C}$ .

When the  $\overline{LD}$  is disabled after a read operation, the K71163682B, K71161882B and K71160882B will first complete burst read operation before entering into deselect mode at the next K clock rising edge.

Then output drivers disabled automatically to high impedance state.

## Echo clock operation

To assure the output traceability, the SRAM provides the output Echo clock, pair of complement clock CQ and  $\overline{CQ}$ , which are synchronized with internal data output.

Echo clocks run free during normal operation.

The Echo clock is triggered by internal output clock signal, and transferred to external through same structures as output driver.

## Write Operations

Write cycles are initiated by activating  $R/\overline{W}$  as low at the rising edge of the positive input clock K. Address is presented and stored in the write address register synchronized with next K clock.

For 2-bit burst DDR operation, it will write two 36-bit, 18-bit or 8-bit data words with each write command. The first "late written" data is transferred and registered in to the device synchronous with next K clock rising edge. Next burst data is transferred and registered synchronous with following  $\overline{K}$  clock rising edge.

Continuous write operations are initiated with K rising edge. And "late written" data is presented to the device on every rising edge of both K and  $\overline{K}$  clocks.

When the  $\overline{LD}$  is disabled, the K71163682B, K71161882B and K71160882B will enter into deselect mode. The device disregards input data presented on the same cycle  $\overline{W}$  disabled.

The K71163682B and K71161882B support byte write operations. With activating  $\overline{BW}_0$  or  $\overline{BW}_1$  ( $\overline{BW}_2$  or  $\overline{BW}_3$ ) in write cycle, only one byte of input data is presented. In K71161882B,  $\overline{BW}_0$  controls write operation to D0:D8,  $\overline{BW}_1$  controls write operation to D9:D17. And in K71163682B  $\overline{BW}_2$  controls write operation to D18:D26,  $\overline{BW}_3$  controls write operation to D27:D35. The the K71160882B support nybble write operations. In K71160882B,  $\overline{NW}_0$  controls write operation to D0:D3,  $\overline{NW}_1$  controls write operation to D4:D7.

## Programmable Impedance Output Buffer Operation

The designer can program the SRAM's output buffer impedance by terminating the ZQ pin to Vss through a precision resistor(RQ). The value of RQ (within 15%) is five times the output impedance desired.

For example, 250 $\Omega$  resistor will give an output impedance of 50 $\Omega$ . Impedance updates occur early in cycles that do not activate the outputs, such as deselect cycles. In all cases impedance updates are transparent to the user and do not produce access time "push-outs" or other anomalous behavior in the SRAM.

There are no power up requirements for the SRAM. However, to guarantee optimum output driver impedance after power up, the SRAM needs 1024 non-read cycles.

## Clock Consideration

K71163682B, K71161882B and K71160882B utilize internal DLL(Delay-Locked Loops) for maximum output data valid window. It can be placed into a stopped-clock state to minimize power with a modest restart time of 1024 clock cycles. Circuitry automatically resets the DLL when absence of input clock is detected.

## Single Clock Mode

K71163682B, K71161882B and K71160882B can be operated with the single clock pair K and  $\overline{K}$ , instead of C or  $\overline{C}$  for output clocks. To operate these devices in single clock mode, C and  $\overline{C}$  must be tied high during power up and must be maintained high during operation. After power up, this device can't change to or from single clock mode. System flight time and clock skew could not be compensated in this mode.

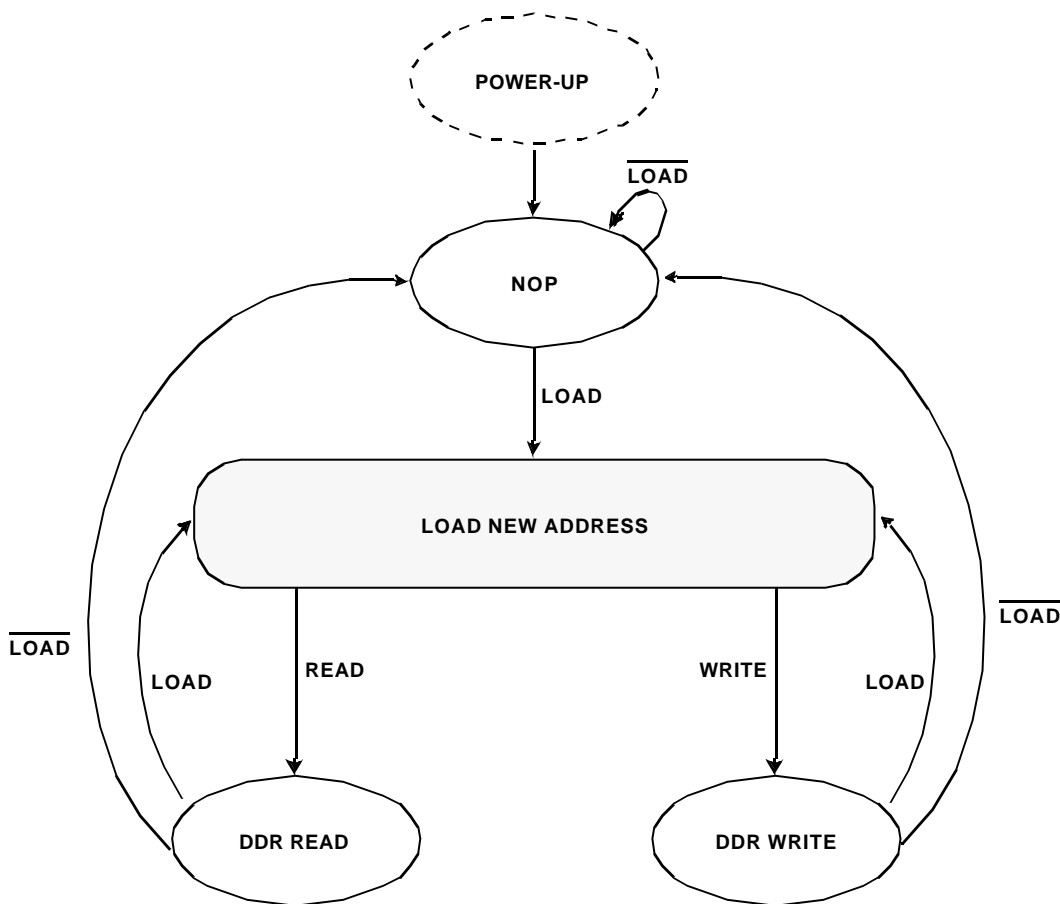

## Depth Expansion

Each port can be selected and deselected independently with  $\overline{RW}$  be shared among all SRAMs and provide a new  $\overline{LD}$  signal for each bank. Before chip deselected, all read and write pending operations are completed.

LINEAR BURST SEQUENCE TABLE

BURST SEQUENCE	Case 1	Case 2
	SA <sub>0</sub>	SA <sub>0</sub>
First Address	0	1
Second Address	1	0

STATE DIAGRAM

- Notes:
1. Internal burst counter is fixed as 2-bit linear, i.e. when first address is A0+0, next internal burst address is A0+1.
  2. "LOAD" refers to read new address active status with  $\overline{LD}$ =Low, " $\overline{LOAD}$ " refers to read new address inactive status with  $\overline{LD}$ =High.
  3. "READ" refers to read active read status with  $R/\overline{W}$ =High, "WRITE" refers to write active status with  $R/\overline{W}$ =Low

TRUTH TABLES

SYNCHRONOUS TRUTH TABLE

K	$\overline{\text{LD}}$	$\text{R}\overline{\text{W}}$	Q		OPERATION
			Q(A0)	Q(A1)	
Stopped	X	X	Previous state	Previous state	Clock Stop
$\uparrow$	H	X	High-Z	High-Z	No Operation
$\uparrow$	L	H	QOUT at $\overline{\text{C}}(t+1)$	QOUT at $\text{C}(t+2)$	Read
$\uparrow$	L	L	Din at $\text{K}(t+1)$	Din at $\overline{\text{K}}(t+1)$	Write

- Notes: 1. X means "Don't Care".  
2. The rising edge of clock is symbolized by ( $\uparrow$ ).  
3. Before enter into clock stop status, all pending read and write operations will be completed.

WRITE TRUTH TABLE<sub>(x18)</sub>

Input Low Voltage	V <sub>IL</sub>		-0.3	V <sub>REF</sub> -0.1	V	8,9	
Input High Voltage	V <sub>IH</sub>		V <sub>REF</sub> +0.1	V <sub>DDQ</sub> +0.3	V	8,10	

Notes: 1. Minimum cycle. I<sub>OUT</sub>=0mA.

2. |I<sub>OH</sub>|=(V<sub>DDQ</sub>/2)/(R<sub>Q</sub>/5) for 175Ω ≤ R<sub>Q</sub> ≤ 350Ω.

3. |I<sub>OL</sub>|=(V<sub>DDQ</sub>/2)/(R<sub>Q</sub>/5) for 175Ω ≤ R<sub>Q</sub> ≤ 350Ω.

4. Minimum Impedance Mode when Z<sub>Q</sub> pin is connected to V<sub>DD</sub>.

5. Operating current is calculated with 50% read cycles and 50% write cycles.

6. Standby current is only after all pending read and write burst operations are completed.

7. Programmable Impedance Mode.

8. These are DC test criteria. DC design criteria is V<sub>REF</sub>±50mV. The AC V<sub>IH</sub>/V<sub>IL</sub> levels are defined separately for measuring timing parameters.

9. V<sub>IL</sub> (Min)DC=-0.3V, V<sub>IL</sub> (Min)AC=-1.5V(pulse width ≤ 3ns).

10. V<sub>IH</sub> (Max)DC=V<sub>DDQ</sub>+0.3, V<sub>IH</sub> (Max)AC=V<sub>DDQ</sub>+0.85V(pulse width ≤ 3ns).

**AC ELECTRICAL CHARACTERISTICS** ( $V_{DD}=1.8V \pm 0.1V$ ,  $T_A=0^{\circ}C$  to  $+70^{\circ}C$ )

PARAMETER	SYMBOL	MIN	MAX	UNIT	NOTES
Input High Voltage	$V_{IH} (AC)$	$V_{REF} + 0.2$	-	V	1,2
Input Low Voltage	$V_{IL} (AC)$	-	$V_{REF} - 0.2$	V	1,2

- Notes:** 1. This condition is for AC function test only, not for AC parameter test.  
2. To maintain a valid level, the transitioning edge of the input must :  
a) Sustain a constant slew rate from the current AC level through the target AC level,  $V_{L(AC)}$  or  $V_{H(AC)}$   
b) Reach at least the target AC level  
c) After the AC target level is reached, continue to maintain at least the target DC level,  $V_{L(DC)}$  or  $V_{H(DC)}$

**Overshoot Timing**

**Undershoot Timing**

**Note:** For power-up,  $V_{IH} \leq V_{DDQ}+0.3V$  and  $V_{DD} \leq 1.7V$  and  $V_{DDQ} \leq 1.4V$   $t \leq 200ms$

C, High to Output High-Z	tCHQZ		0.45		0.45		0.45		0.50	ns	3
C, High to Output Low-Z	tCHQX1	-0.45		-0.45		-0.45		-0.50		ns	3
<b>Setup Times</b>											
Address valid to K rising edge	tAVKH	0.40		0.40		0.60		0.70		ns	
Control inputs valid to K rising edge	tIVKH	0.40		0.40		0.60		0.70		ns	2
Data-in valid to K, $\overline{K}$ rising edge	tDVKH	0.28		0.30		0.40		0.50		ns	
<b>Hold Times</b>											
K rising edge to address hold	tkHAX	0.40		0.40		0.60		0.70		ns	
K rising edge to control inputs hold	tkHIX	0.40		0.40		0.60		0.70		ns	
K, $\overline{K}$ rising edge to data-in hold	tkHDX	0.28		0.30		0.40		0.50		ns	

- Notes:** 1. All address inputs must meet the specified setup and hold times for all latching clock edges.  
2. Control signals are  $\overline{R}$ ,  $\overline{W}$ ,  $\overline{BW_0}$ ,  $\overline{BW_1}$  and ( $\overline{NW_0}$ ,  $\overline{NW_1}$ , for x8) and ( $\overline{BW_2}$ ,  $\overline{BW_3}$ , also for x36)  
3. If C,  $\overline{C}$  are tied high, K,  $\overline{K}$  become the references for C,  $\overline{C}$  timing parameters.  
4. To avoid bus contention, at a given voltage and temperature tCHQX1 is bigger than tCHQZ.  
The specs as shown do not imply bus contention because tCHQX1 is a MIN parameter that is worst case at totally different test conditions (0°C, 1.9V) than tCHQZ, which is a MAX parameter (worst case at 70°C, 1.7V)  
It is not possible for two SRAMs on the same board to be at such different voltage and temperature.  
5. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.  
6. V<sub>DD</sub> slew rate must be less than 0.1V DC per 50 ns for DLL lock retention. DLL lock time begins once V<sub>DD</sub> and input clock are stable.  
7. Echo clock is very tightly controlled to data valid/data hold. By design, there is a ± 0.1 ns variation from echo clock to data.  
The data sheet parameters reflect tester guardbands and test setup variations.

**PIN CAPACITANCE**

PRMETER	SYMBOL	TESTCONDITION	TYP	MAX	UNIT	NOTE
Address Control Input Capacitance	C <sub>IN</sub>	V <sub>IN</sub> =0V	4	5	pF	
Input and Output Capacitance	C <sub>OUT</sub>	V <sub>OUT</sub> =0V	6	7	pF	
Clock Capacitance	C <sub>CLK</sub>	-	5	6	pF	

**Note:** 1. Parameters are tested with R<sub>Q</sub>=250Ω and V<sub>DDQ</sub>=1.5V.  
 2. Periodically sampled and not 100% tested.

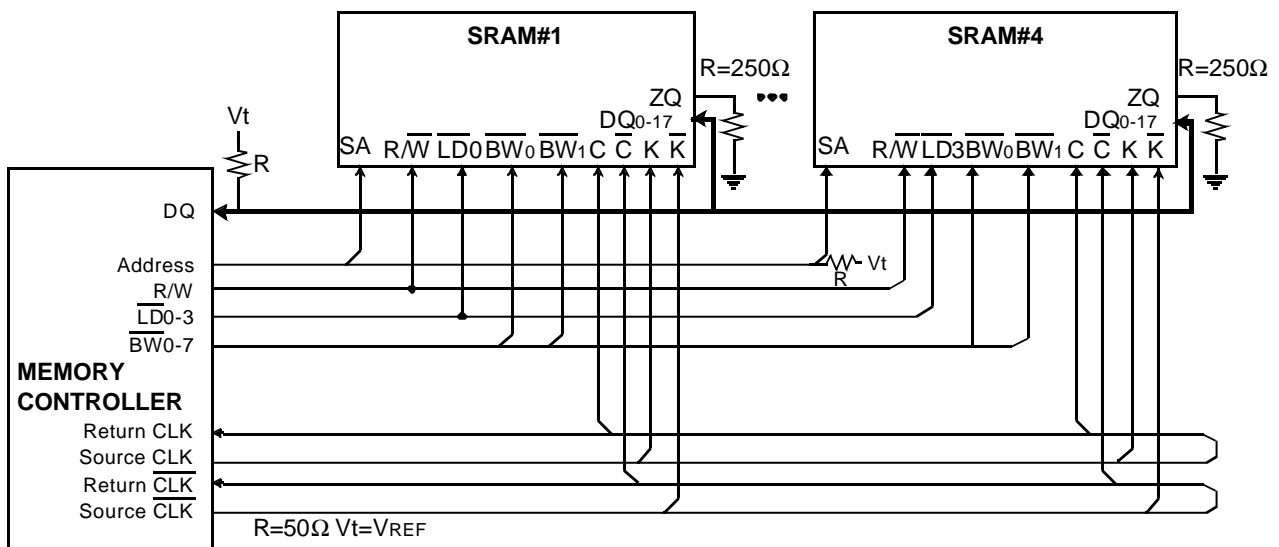

**THERMAL RESISTANCE**

PRMETER	SYMBOL	TYP	UNIT	NOTE
Junction to Ambient	θ <sub>JA</sub>	TBD	°C/W	
Junction to Case	θ <sub>JC</sub>	TBD	°C/W	
Junction to Pins	θ <sub>JB</sub>	TBD	°C/W	

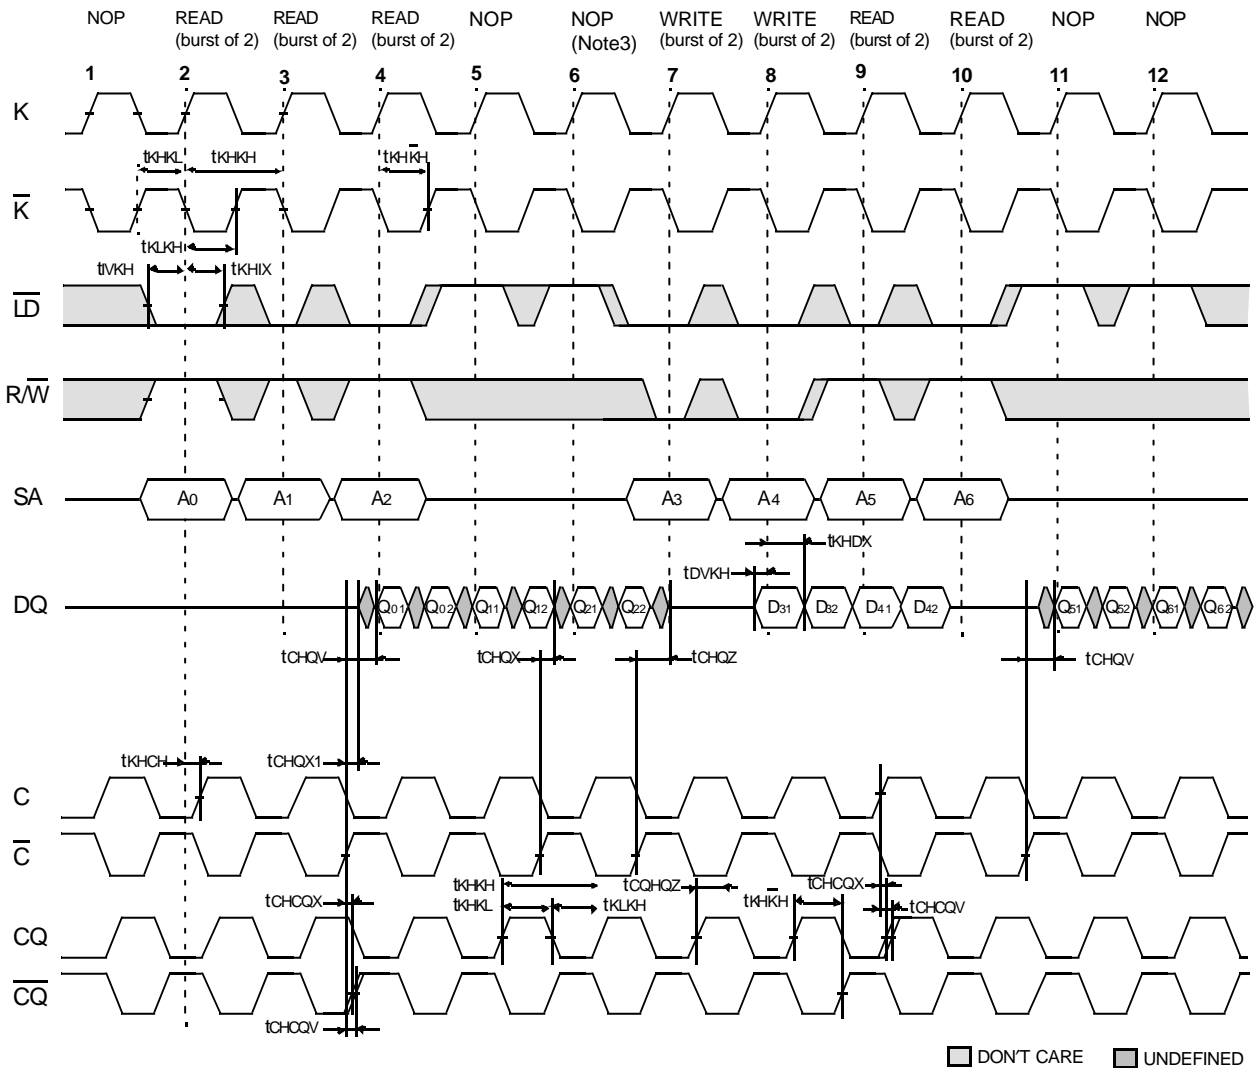

**Note:** Junction temperature is a function of on-chip power dissipation, package thermal impedance, mounting site temperature and mounting site thermal impedance. T<sub>J</sub>=T<sub>A</sub> + P<sub>D</sub> x θ<sub>JA</sub>

**APPLICATION INFORMATION**

**2Mx18**

TIMING WAVE FORMS OF READ, WRITE AND NOP

NOTE

1. Q<sub>01</sub> refers to output from address A. Q<sub>02</sub> refers to output from the next internal burst address following A, etc.
2. Outputs are disabled(High-Z) one clock cycle after a NOP.
3. The second NOP cycle is not necessary for correct device operation; however, at high clock frequencies, it may be required to prevent bus contention.

IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG

This part contains an IEEE standard 1149.1 Compatible Test Access Port(TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. Internal data is not driven out of the SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to Vss to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to VDD through a resistor. TDO should be left unconnected.

JTAG Block Diagram

JTAG Instruction Coding

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	1
0	0	1	IDCODE	Identification Register	3
0	1	0	SAMPLE-Z	Boundary Scan Register	2
0	1	1	RESERVED	Do Not Use	6
1	0	0	SAMPLE	Boundary Scan Register	5
1	0	1	RESERVED	Do Not Use	6
1	1	0	RESERVED	Do Not Use	6
1	1	1	BYPASS	Bypass Register	4

NOTE :

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to Vss when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.

TAP Controller State Diagram

**SCAN REGISTER DEFINITION**

Part	Instruction Register	Bypass Register	ID Register	Boundary Scan
512Kx36	3 bits	1 bit	32 bits	107 bits
1Mx18	3 bits	1 bit	32 bits	107 bits
2Mx8	3 bits	1 bit	32 bits	107 bits
