DESCRIPTION

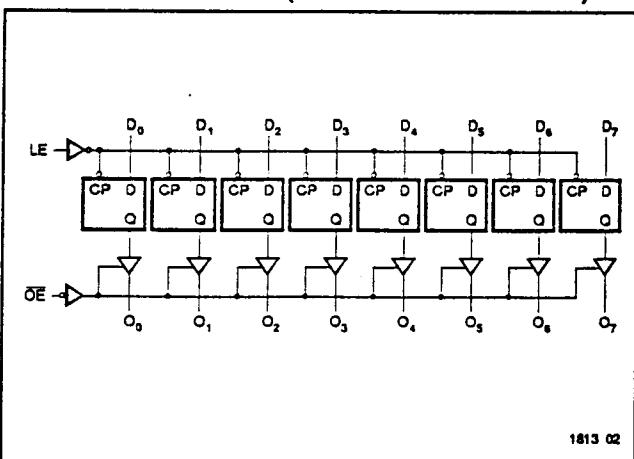

The 'FCT373 and 'FCT573 consists of eight latches with 3-state outputs for bus organized system applications. When latch enable (LE) is HIGH, the flip flops appear transparent to the data. Data that meets the required set-up times are latched when LE transitions from HIGH to LOW. Data appears on the bus when the output enable

(OE) is LOW. When output enable is HIGH, the bus output is in the high impedance state. In this mode, data may be entered into the latches. The 'FCT573 is the same as the 'FCT373, except that the outputs are inverted. The 'FCT573 is identical to 'FCT373 except that all the inputs are on one side of the package and the outputs on the other side.

Notes:

1. Typical limits are at $V_{CC} = 5.0\text{V}$, $T_A = +25^\circ\text{C}$ ambient.
2. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect

operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

3. This parameter is guaranteed but not tested.
