

MM54C74/MM74C74 Dual D Flip-Flop

General Description

The MM54C74/MM74C74 dual D flip-flop is a monolithic complementary MOS (CMOS) integrated circuit constructed with N- and P-channel enhancement transistors. Each flip-flop has independent data, preset, clear and clock inputs and Q and \bar{Q} outputs. The logic level present at the data input is transferred to the output during the positive going transition of the clock pulse. Preset or clear is independent of the clock and accomplished by a low level at the preset or clear input.

Features

- Supply voltage range 3V to 15V
- Tenth power TTL compatible Drive 2 LPT²L loads
- High noise immunity 0.45 V_{CC} (typ.)

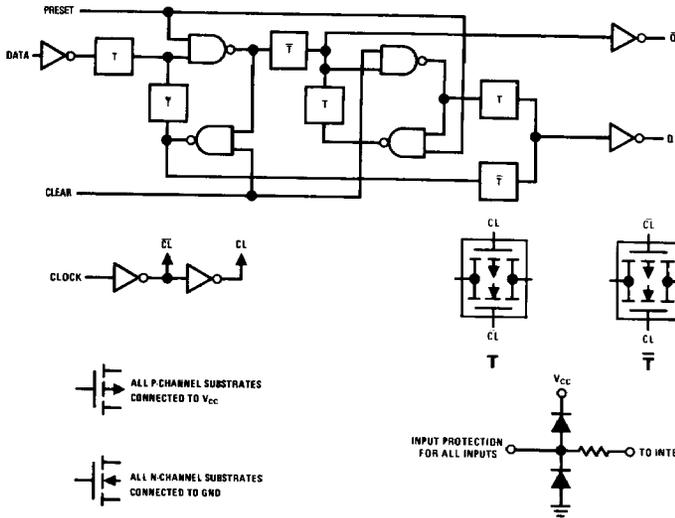

- Low power
- Medium speed operation

50 nW (typ.)
10 MHz (typ.)
with 10V supply

Applications

- Automotive
- Data terminals
- Instrumentation
- Medical electronics
- Alarm system
- Industrial electronics
- Remote metering
- Computers

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.
