

LC75348, 75348M

Single-Chip Electronic Volume and Tone Control System

Overview

The LC75348 and LC75348M are electronic volume and tone control ICs that provide volume, balance, 2-band equalizer, input gain control, and input switching functions while requiring a minimal number of external components.

Functions

- Volume: 81 levels: 0 dB to -79 dB (in 1 dB steps) and $-\infty$.
- The left and right channels are controlled independently, allowing a balance function to be implemented.
- Bass: Peaking characteristics bass control with ± 20 dB range in 2 dB steps.
- Treble: Shelving characteristics treble control with ± 10 dB range in 2 dB steps.
- Selector: One of 4 inputs can be selected for both left and right channels.
- Input gain: Input signal amplification from 0 to $+30$ dB (in 2 dB steps)

Features

- Built-in buffer amplifiers reduce the number of external components required.
- Fabricated in a silicon gate CMOS process for minimal switching noise from built-in switches and minimal switching noise even when there is no input signal.
- Built-in zero cross circuits minimize switching noise when input signals are present.
- Built-in $V_{DD}/2$ reference voltage generator circuit.
- All functions are controlled from serial data. Supports the CCB bus.

- CCB is a trademark of SANYO ELECTRIC CO., LTD.
- CCB is SANYO's original bus format and all the bus addresses are controlled by SANYO.

■ Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.

■ SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

Equivalent Circuit

Control System Timing and Data Format

The stipulated serial data must be input to the CL, DI, and CE pins to control the LC75348 and LC75348M. The data structure has a total of 40 bits, of which 8 bits are address and 32 bits are data.

• Address code (B0 to A3)

The data has an 8-bit address code, which allows this IC to be used with the SANYO CCB serial bus.

Address code (LSB)

Internal Equivalent Circuits

- Selector Block Equivalent Circuit

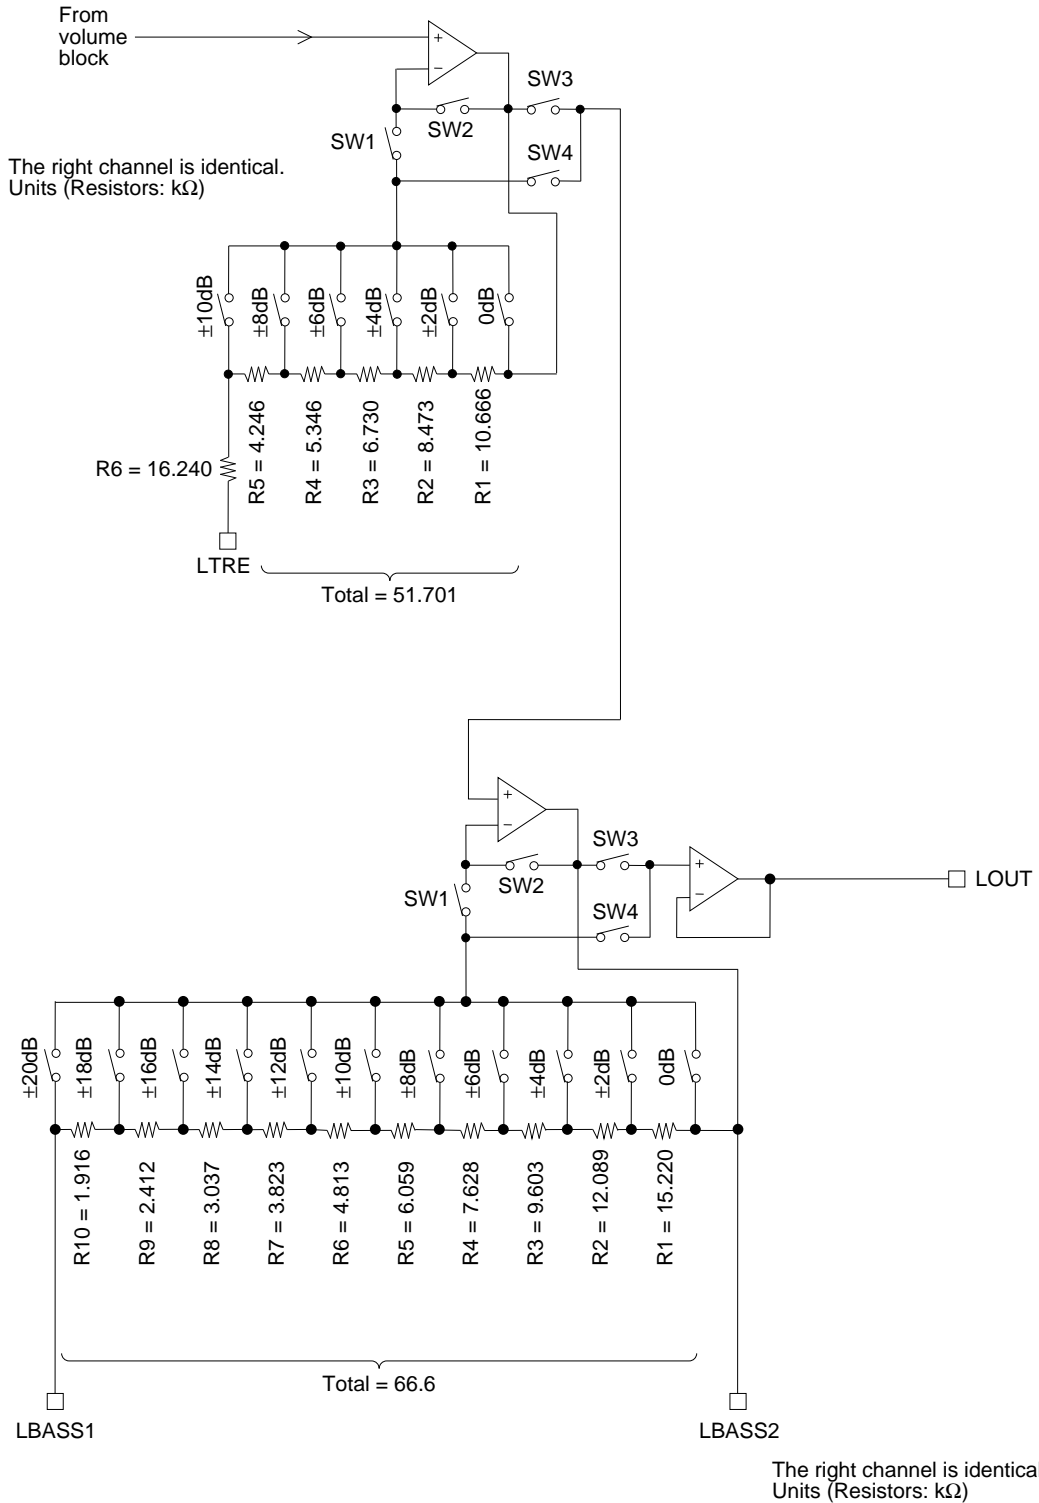

LC75348, 75348M

• Volume Control Block Internal Equivalent Circuit

• Treble/Bass Band Block Internal Equivalent Circuit

For boost, switches SW1 and SW3 are on, and for cut, switches SW2 and SW4 are on.
For 0 dB, the 0dB SW, SW2, and SW3 are on.

Bass Band Circuit

This section presents the equivalent circuit and the formulas for calculating the R and C values for a 100 Hz center frequency.

- Bass band equivalent circuit

- Sample calculation

Specifications: Center frequency: $f_0 = 100$ Hz

Gain at maximum boost: $G = 20$ dB

Assume $R_1 = 0$, $R_2 = 66.6$ k Ω , and $C_1 = C_2 = C$.

- (1) Determine R_3 from the $G = 20$ dB condition.

$$G_{+20dB} = 20 \times \text{LOG}_{10} \left(1 + \frac{R_2}{2R_3} \right)$$

$$R_3 = \frac{R_2}{2(10^{G+20dB/20} - 1)} = \frac{66000}{2 \times (10 - 1)} \cong 3.7\text{k}\Omega$$

- (2) Determine C from the center frequency $f_0 = 100$ Hz condition

$$f_0 = \frac{1}{2\pi\sqrt{R_3R_2C_1C_2}}$$

$$C = \frac{1}{2\pi f_0 \sqrt{R_3R_2}} = \frac{1}{2\pi \times 100 \sqrt{66000 \times 3700}} \cong 0.1\mu F$$

- (3) Determine Q

$$Q = \frac{R_3R_2}{2R_3} \cdot \frac{1}{\sqrt{R_3R_2}} \cong 2.1$$

Treble Band Circuit

The treble band circuit can provide shelving characteristics.

This section presents the equivalent circuit for boost operation and the calculation formulas.

- Sample calculation

Specifications: Set frequency: $f = 26,000$ Hz

Gain at maximum boost: $G_{+10\text{ dB}} = 10$ dB

Assume $R1 = 16.240$ K Ω , and $R2 = 35.461$ K Ω .

The constants mentioned above are calculated as follows.

$$G = 20 \times \text{LOG}_{10} \left(1 + \frac{R2}{\sqrt{R1^2 + (1 / \omega C)^2}} \right)$$

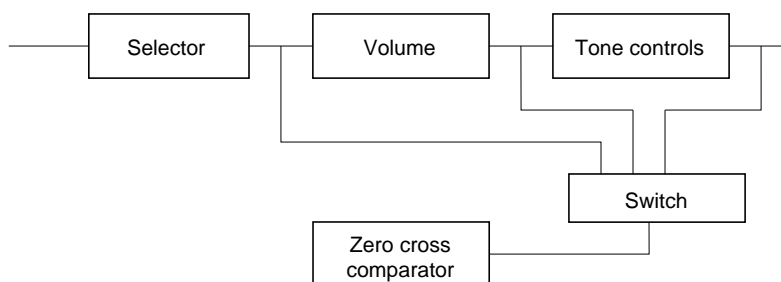

$$C = \frac{1}{2\pi f \sqrt{\left(\frac{R2}{10^{G/20} - 1} \right)^2 - R1^2}}$$

$$= \frac{1}{2\pi 26000 \sqrt{\left(\frac{35461}{3.16 - 1} \right)^2 - 16240^2}} \cong 2700(\text{pF})$$

Usage Notes

- The internal transistor states are undefined when power is first applied. Applications must mute the output until control data has been written to the IC.
- Operational description of the zero cross switching circuit

The LC75348 and LC75348M provide a function that can switch the zero cross comparator signal detection point, allowing applications to select an optimal detection point for the block whose data is being updated. Basically, switching noise can be minimized if the signal immediately following the block whose data is updated is input to the zero cross comparator. This means that the detection point must be switched each time data is updated.

LC75348 and LC75348M Zero Cross Detection Circuit

- Zero cross switching control procedure

The zero cross switching control procedure consists of three steps. First, set the zero cross control bit to zero cross detection mode (D25 = 0), then specify the block for detection (with bits D28 and D29), and finally transfer the data. Since these control bits are latched first, immediately after the data is transferred, i.e. on the CE falling edge, the mode can be set in a single data transfer operation when updating the volume control or other control block data. The figure below presents an example of the control used when updating the volume control block data.

D25	D28	D29
0	1	0

Zero cross detection mode setting Volume control block setting

- Zero cross timer setting

If the input signal is lower than the zero cross comparator detection sensitivity, or if a low-frequency signal is input, the state in which the circuit cannot detect a zero cross may continue and the input data will not be latched during that period.

The zero cross timer sets a time for the data to be latched forcibly in states such as this where a zero cross cannot be detected.

For example, to set a 25 ms time:

$$T = 0.69 CR$$

Assume $C = 0.068 \mu\text{F}$. The R will be:

$$R = \frac{25 \times 10^{-3}}{0.69 \times 0.068 \times 10^{-6}} \approx 530 \text{ k}\Omega$$

Normally, a time in the range 10 to 50 ms is used.

- Notes on serial data transfer

(1) Cover the CL, DI, and CE signal lines with the ground pattern or use shielded lines to prevent the high-frequency digital signals carried by these lines from entering the analog signal system.

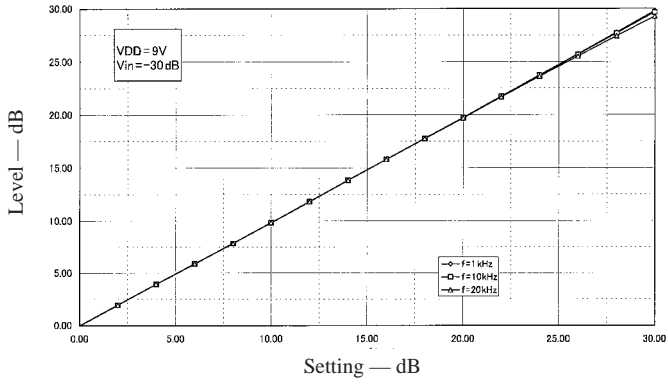

(2) The LC75348 and LC75348M data format consists of 8 bits of address and 32 bits of data. When transmitting data as an even multiple of 8 bits (when transferring 36 bits of data), use the data format shown below.

LC75348 and LC75348M Data Reception in Multiples of 8 Bits
