74VHCT244A
Octal Buffer/Line Driver with 3-STATE Outputs

General Description

The VHCT244A is an advanced high speed CMOS octal bus transceiver fabricated with silicon gate CMOS technology. It achieves high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. The VHCT244A is a non-inverting 3-STATE buffer having two active-LOW output enables. This device is designed to be used as 3-STATE memory address drivers, clock drivers, and bus oriented transmitter/receivers.

Protection circuits ensure that 0V to 7V can be applied to the input and output (Note 1) pins without regard to the supply voltage. These circuits prevent device destruction due to mismatched supply and input/output voltages. This device can be used to interface 5V to 3V systems and two supply systems such as battery back up.

Note 1: Outputs in OFF-State

Features

- High Speed: t_{PD} = 5.9 ns (typ) at V_{CC} = 5V
- Power down protection is provided on inputs and outputs
- Low power dissipation: I_{CC} = 4 μA (max) @ T_A = 25°C
- Pin and function compatible with 74HCT244

Note 2: Absolute Maximum Ratings are values beyond which the device may be damaged or have its useful life impaired. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation outside databook specifications.

Note 3: HIGH or LOW state. I_{OUT} absolute maximum rating must be observed.

Note 4: When outputs are in OFF-STATE or when V_{CC} = OV.

Note 5: V_{OUT} < GND, V_{OUT} > V_{CC} (Outputs Active).

Note 6: Unused inputs must be held HIGH or LOW. They may not float.

Note 9: C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation: I_{CC} (opr.) = $C_{PD} * V_{CC} * f_{IN} + I_{CC}/8$ (per F/F). The total C_{PD} when n pcs. of the Octal D Flip-Flop operates can be calculated by the equation: C_{PD} (total) = 20 + 12n.
