

NCP81109C

Single-Phase Voltage Regulator with SVID Interface for Computing Applications

High Switching Frequency, High Efficiency, Integrated Power MOSFETs

The NCP81109C, a single-phase synchronous buck regulator, integrates power MOSFETs to provide a high-efficiency and compact-footprint power management solution for new generation computing CPUs. The device is able to deliver up to 14 A TDC output current on an adjustable output with SVID interface. Operating in high switching frequency up to 1.2 MHz allows employing small size inductors and capacitors while maintaining high efficiency due to integrated solution with high performance power MOSFETs. Current-mode RPM control with feedforward from both input power supply and output voltage ensures stable operation over wide operation condition. The NCP81109C is in a QFN48 6 x 6 mm package.

Features

- Meets Intel® Server Specifications
- 5 V to 20 V Input Voltage Range
- 0.9 V/1.35 V Fixed Boot Voltage
- Adjustable Output Voltage with SVID Interface
- Integrated Gate Driver and Power MOSFETs
- Up to 14 A TDC Output Current
- 500 kHz ~ 1.2 MHz Switching Frequency
- Current-Mode RPM Control
- Programmable SVID Address and ICCMax
- Programmable DVID Feed-Forward to Support Fast DVID
- Feedforward Operation for Input Supply Voltage and Output Voltage
- Output Over-Voltage and Under-Voltage Protections
- External Current Limitation Programming with Inductor Current Sense
- QFN48, 6 x 6 mm, 0.4 mm Pitch Package
- This is a Pb-Free Device

Typical Applications

- Server Applications

PIN DESCRIPTION

Pin	Name	Type	Description
1	VRHOT#	Logic Output	VR HOT. Logic low output represents over temperature.
2	SDIO	Logic Bidirectional	Serial Data IO Port. Data port of SVID interface.
3	ALERT#	Logic Output	ALERT. Open-drain output. Provides a logic low valid alert signal of SVID interface.
4	SCLK	Logic Input	Serial Clock. Clock input of SVID interface.
5, 32, 49	GND	Analog Ground	Analog Ground. Ground of internal control circuits. Must be connected to the system ground.
6	VRRDY	Logic Output	Voltage Regulator Ready. Open-drain output. Provides a logic high valid power good output signal, indicating the regulator's output is in regulation window.
7, 11-17, 50	VIN	Power Input	Power Supply Input. These pins are the power supply input pins of the device, which are connected to drain of internal high-side power MOSFET. 22 μ F or more ceramic capacitors must bypass this input to power ground. The capacitors should be placed as close as possible to these pins.
8	BST	Power Bidirectional	Bootstrap. Provides bootstrap voltage for the high-side gate driver. A 0.1 μ F ~ 1 μ F ceramic capacitor is required from this pin to SW (pin 10). A 1 – 2 Ω resistor may be employed in series with the BST cap to reduce switching noise and ringing when needed.
9	GH	Analog Output	Gate of High-Side MOSFET. Directly connected with the gate of the high-side power MOSFET.
10	SW	Power Return	Switching Node. Provides a return path for integrated high-side gate driver. It is internally connected to source of high-side MOSFET.
18, 25-29, 51	SW	Power Output	Switch Node. Pins to be connected to an external inductor. These pins are interconnection between internal high-side MOSFET and low-side MOSFET.
19-24	PGND	Power Ground	Power Ground. These pins are the power supply ground pins of the device, which are connected to source of internal low-side power MOSFET. Must be connected to the system ground.
30	GL	Analog Output	Gate of Low-Side MOSFET. Directly connected with the gate of the low-side power MOSFET.
31	VBOOT	Analog Input	Boot-Up Voltage. A resistor from this pin to ground programs SVID address.
33	VCCP	Analog Power	Voltage Supply of Gate Driver. Power supply input pin of internal gate driver. A 4.7 μ F or larger ceramic capacitor bypasses this input to ground. This capacitor should be placed as close as possible to this pin.
34	TSENSE	Analog	Temperature Sense. An external temperature sense network is connected to this pin.
35	IMAX	Analog Input	Current Maximum. A resistor from this pin to ground programs IMAX.
36	IOUT	Analog Output	OUT Current Monitor. Provides output signal representing output current by connecting a resistor from this pin to ground. Shorting this pin to ground disables IMON function.
37	ILIM	Analog Output	Limit of Current. A resistor from this pin to CSCOMP programs over-current threshold with inductor current sense.
38	CSCOMP	Analog Output	Current Sense COMP. Output pin of current sense amplifier.
39	CSSUM	Analog Input	Current Sense SUM. Inverting input of current sense amplifier.
40	CSREF	Analog Input	Current Sense Reference. Non-Inverting input of current sense amplifier.
41	FREQ	Analog Input	Frequency. A resistor from this pin to ground programs switching frequency.
42	COMP	Analog	Compensation. Output pin of error amplifier.
43	FB	Analog Input	Feedback. Inverting input to error amplifier.
44	DIFFOUT	Analog Output	Differential Amplifier Output. Output pin of differential voltage sense amplifier.
45	VSN	Analog Input	Voltage Sense Negative Input. Inverting input of differential voltage sense amplifier. It is also used for DVID feed forward function with an external resistor.
46	VSP	Analog Input	Voltage Sense Positive Input. Non-inverting input of differential voltage sense amplifier.

NCP81109C

PIN DESCRIPTION

Pin	Name	Type	Description
47	VCC	Analog Power	Voltage Supply of Controller. Power supply input pin of control circuits. A 1 μ F or larger ceramic capacitor bypasses this input to ground. This capacitor should be placed as close as possible to this pin.
48	EN	Logic Input	Enable. Logic high enables the device and logic low makes the device in standby mode.

MAXIMUM RATINGS

Rating	Symbol	Value		Unit
		Min	Max	
Power Supply Voltage to PGND	V_{VIN}		30	V
Switch Node to PGND	V_{SW}		30	V
Analog Supply Voltage to GND	V_{CC}, V_{CCP}	-0.3	6.5	V
BST to PGND	BST_PGND	-0.3	33 38 (<50 ns)	V
BST to SW	BST_SW	-0.3	6.5	V
GH to SW	GH	-0.3 -2 (<200 ns)	BST+0.3	V
GL to GND	GL	-0.3 -2 (<200 ns)	VCCP+0.3	V
VSN to GND	VSN	-0.3	0.3	V
IOUT	IOUT	-0.3	2.5	V
PGND to GND	PGND	-0.3	0.3	V
Other Pins		-0.3	VCC+0.3	V
Latch up Current: (Note 1) All pins, except digital pins Digital pins	I_{LU}	-100 -10	100 10	mA
Operating Junction Temperature Range	T_J	-10	125	$^{\circ}$ C
Operating Ambient Temperature Range	T_A	-10	100	$^{\circ}$ C
Storage Temperature Range	T_{STG}	-40	150	$^{\circ}$ C
Thermal Resistance Junction to Board (Note 2)	$R_{\theta JB}$	8.2		$^{\circ}$ C/W
Thermal Resistance Junction to Ambient (Note 2)	$R_{\theta JA}$	21.8		$^{\circ}$ C/W
Power Dissipation at $T_A = 25^{\circ}$ C (Note 3)	P_D	4.59		W
Moisture Sensitivity Level (Note 4)	MSL	3		-

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Latch up Current per JEDEC standard: JESD78 class II.
2. The thermal resistance values are dependent of the internal losses split between devices and the PCB heat dissipation. This data is based on a typical operation condition with a 4-layer FR-4 PCB board, which has two, 1-ounce copper internal power and ground planes and 2-ounce copper traces on top and bottom layers with approximately 80% copper coverage. No airflow and no heat sink applied (reference EIA/JEDEC 51.7). It also does not account for other heat sources that may be present on the PCB next to the device in question (such as inductors, resistors etc.)
3. The maximum power dissipation (P_D) is dependent on input voltage, output voltage, output current, external components selected, and PCB layout. The reference data is obtained based on $T_{JMAX} = 125^{\circ}$ C and $R_{\theta JA} = 21.8^{\circ}$ C/W.
4. Moisture Sensitivity Level (MSL): 3 per IPC/JEDEC standard: J-STD-020D.1.

NCP81109C

ELECTRICAL CHARACTERISTICS ($V_{IN} = 12\text{ V}$, $V_{CC} = V_{CCP} = 5\text{ V}$, $V_{OUT} = 1.0\text{ V}$, typical values are referenced to $T_J = 25^\circ\text{C}$, Min and Max values are referenced to T_J from -10°C to 100°C , unless otherwise noted.)

Characteristics	Test Conditions	Symbol	Min	Typ	Max	Unit

5. Guaranteed by design, not tested in production.
6. $T_J = 25^\circ\text{C}$.

NCP81109C

ELECTRICAL CHARACTERISTICS ($V_{IN} = 12\text{ V}$, $V_{CC} = V_{CCP} = 5\text{ V}$, $V_{OUT} = 1.0\text{ V}$, typical values are referenced to $T_J = 25^\circ\text{C}$, Min and Max values are referenced to T_J from -10°C to 100°C , unless otherwise noted.)

Characteristics	Test Conditions	Symbol	Min	Typ	Max	Unit
-----------------	-----------------	--------	-----	-----	-----	------

OVER VOLTAGE PROTECTION

Over Voltage Threshold Above DAC	VSP rising		350	400	425	mV
Over Voltage Delay	VSP rising to GH low			50		ns

UNDER VOLTAGE PROTECTION

Under Voltage Threshold Below DAC	VSP falling		250	300	350	mV
Under-voltage Delay				5		μs

OVER CURRENT PROTECTION

ILIM Threshold Current (OCP shutdown after 50 μs delay)		I_{LIMTH_SLOW}	9.0	10.0	11.0	μA
ILIM Threshold Current (immediate OCP shutdown)		I_{LIMTH_FAST}	13.5	15.0	16.5	μA

IOUT OUTPUT

Current Gain	($I_{OUTCURRENT}$) / ($I_{LIMCURRENT}$); $R_{ILIM} = 20\text{ k}\Omega$; $R_{IOUT} = 5.0\text{ k}\Omega$; DAC = 0.8 V, 1.25 V, 1.52 V		9.5	10	10.5	A/A
Input Referred Offset Voltage	$I_{LIM} - CSREF$		-2.0	-	2.0	mV
Output Source Current	I_{LIM} sink current = 80 μA			800		μA

HIGH-SIDE MOSFET

Drain-to-Source ON Resistance	$V_{GS} = 4.5\text{ V}$, $I_D = 10\text{ A}$	R_{ON_H}	-	8.0	-	$\text{m}\Omega$
-------------------------------	---	-------------	---	-----	---	------------------

LOW-SIDE MOSFET

Drain-to-Source ON Resistance	$V_{GS} = 4.5\text{ V}$, $I_D = 10\text{ A}$	R_{ON_L}	-	4.0	-	$\text{m}\Omega$
-------------------------------	---	-------------	---	-----	---	------------------

HIGH-SIDE GATE DRIVE

Pull-High Drive ON Resistance	$V_{BST} - V_{SW} = 5\text{ V}$	R_{DRV_HH}	-	1.2	2.8	Ω
Pull-Low Drive ON Resistance	$V_{BST} - V_{SW} = 5\text{ V}$	R_{DRV_HL}	-	0.8	2.0	Ω
GH Propagation Delay Time	From GL falling to GH rising	T_{GH_d}		15		ns

LOW-SIDE GATE DRIVE

Pull-High Drive ON Resistance	$V_{CCP} - V_{PGND} = 5\text{ V}$	R_{DRV_LH}	-	0.9	2.8	Ω
Pull-Low Drive ON Resistance	$V_{CCP} - V_{PGND} = 5\text{ V}$	R_{DRV_LL}	-	0.4	1.25	Ω
GL Propagation Delay Time	From GH falling to GL rising	T_{GL_d}		10		ns

SW to PGND RESISTANCE

SW to PGND Pull-Down Resistance	(Note 5)	R_{SW}	-	1.88	-	$\text{k}\Omega$
---------------------------------	----------	----------	---	------	---	------------------

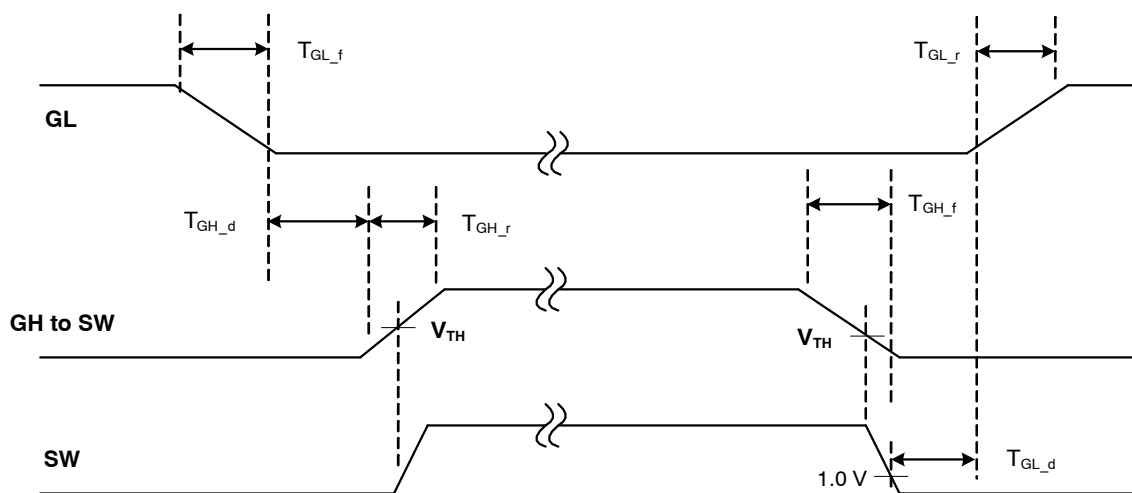

BOOTSTRAP RECTIFIER SWITCH

On Resistance	$EN = L$ or $EN = H$ and $DRVL = H$	R_{on_BST}	5	13	20	Ω
---------------	-------------------------------------	---------------	---	----	----	----------

5. Guaranteed by design, not tested in production.

6. $T_J = 25^\circ\text{C}$.

Table 4. SUPPORTED REGISTERS

Index	Name	Description	Access	Default
00h	Vendor ID	Uniquely identifies the VR vendor. The vendor ID assigned by Intel to ON Semiconductor is 0x1Ah	R	1Ah
01h	Product ID	Uniquely identifies the VR product. The VR vendor assigns this number.	R	19h
02h	Product Revision	Uniquely identifies the revision or stepping of the VR control IC. The VR vendor assigns this data.	R	00h
03h	Date code ID		R	00h
05h	Protocol ID	Identifies the SVID Protocol the controller supports	R	01h
06h	Capability	<p>Informs the Master of the controller's Capabilities, 1 = supported, 0 = not supported</p> <p>Bit 7 = Iout_format. Bit 7 = 0 when 1A = 1LSB of Reg 15h. Bit 7 = 1 when Reg 15 FFh = Icc_Max. Default = 1</p> <p>Bit 6 = ADC Measurement of Temp Supported = 1</p> <p>Bit 5 = ADC Measurement of Pin Supported = 0</p> <p>Bit 4 = ADC Measurement of Vin Supported = 0</p> <p>Bit 3 = ADC Measurement of Iin Supported = 0</p> <p>Bit 2 = ADC Measurement of Pout Supported = 1</p> <p>Bit 1 = ADC Measurement of Vout Supported = 1</p> <p>Bit 0 = ADC Measurement of Iout Supported = 1</p>	R	D7h
10h	Status_1	Data register read after ALERT# signal is asserted. Conveying the status of the VR.	R	00h
11h	Status_2	Data register showing optional status_2 data.	R	00h
12h	Temp zone	Data register showing temperature zones the system is operating in	R	00h
15h	I_out	8 bit binary word ADC of current. This register reads 0xFF when the IOUT(A) pin voltage is 2 V. The IOUT(A) voltage should be scaled with an external resistor to ground such that a load equal to Icc_Max generates a 2 V signal.	R	01h
16h	V_out	8 bit binary ADC of output voltage between VSP and VSN. LSB size is 15.625 mV	R	01h
17h	VR_Temp	8 bit binary word ADC of voltage. Binary format in deg C, IE 100C = 64h. A value of 00h indicates this function is not supported	R	01h
18h	P_out	8 bit binary word representative of output power. The output voltage is multiplied by the output current value and the result is stored in this register. A value of 00h indicates this function is not supported	R	01h
1Ch	Status 2 Last read	When the status 2 register is read its contents are copied into this register. The format is the same as the Status 2 Register.	R	00h
21h	Icc_Max	Data register containing the Icc_Max. The value is measured on the ICCMAX pin on power up and placed in this register. From that point on the register is read only.	R	00h
22h	Temp_Max	Data register containing the max temperature and the level VR_hot asserts. This value defaults to 100°C and programmable over the SVID Interface	R/W	64h
24h	SR_fast	Slew Rate for SetVID_fast commands. Binary format in mV/μs.	R	0Eh
25h	SR_slow	Slew Rate for SetVID_slow commands. It is 4X slower than the SR_fast rate. Binary format in mV/μs	R	03h
26h	Vboot	The NCP81109C ramps to Vboot and holds at Vboot until it receives a new SVID SetVID command to move to a different voltage. Default value = 0 V.	R	00h
2Ah	SR_Slow selector	<p>Fast_SR/2</p> <p>Fast_SR/4: default</p> <p>Fast_SR/8</p> <p>Fast_SR/16</p>	R/W	02h
2Bh	PS4 exit latency	Reflects the latency of exiting PS4 state. The exit latency is defined as the time duration, in μs, from the ACK of the SETVID Slow/Fast command to the output voltage beginning to ramp	R	8Ch
2Ch	PS3 exit latency	Reflects the latency of exiting PS3 state. The exit latency is defined as the time duration, in μs, from the ACK of the SETVID/SetPS command until the controller is capable of supplying max current of the command PS state.	R	55h
2Dh	EN to Ready for SVID command (TA)	Reflects the latency from enable assertion to the VR controller being ready to accept SVID commands.	R	C8h

NCP81109C

Table 4. SUPPORTED REGISTERS

Index	Name	Description	Access	Default
30h	Vout_Max	Programmed by master and sets the maximum VID the VR will support. If a higher VID code is received, the VR should respond with "not supported" acknowledge. VR 12 VID format.	RW	FBh
31h	VID setting	Data register containing currently programmed VID voltage. VID data format.	RW	00h
32h	Pwr State	Register containing the current programmed power state.	RW	00h

NCP81109C

DETAILED DESCRIPTION

General

The NCP81109C, a single-phase synchronous buck regulator, integrates power MOSFETs to provide a high-efficiency and compact-footprint power management solution for new generation computing CPUs. The device is able to deliver up to 14 A TDC output current on an adjustable output with SVID interface. Operating in high switching frequency up to 1.2 MHz allows employing small size inductors and capacitors while maintaining high

efficiency due to integrated solution with high performance power MOSFETs. Current-mode RPM control with feedforward from both input power supply and output voltage ensures stable operation over wide operation condition.

Operation Modes

The NCP81109C implements PS0, PS1, PS2, PS3, and PS4 power operation modes as shown in Table 5.

Table 5. POWER STATUS AND OPERATION MODES

Power Status	Operation Mode
PS0	Forced CCM mode – normal mode
PS1	Forced CCM mode – low power mode
PS2	Auto CCM/DCM mode – very low power mode
PS3	Auto CCM/DCM mode – ultra low power mode
PS4	Vout = 0, SVID active only

Current-Mode RPM Operation

The NCP81109C operates with the current-mode Ramp-Pulse-Modulation (RPM) scheme in PS0/1/2/3 operation modes. In forced CCM mode, the inductor current is always continuous and the device operates in quasi-fixed switching frequency, which has a typical value programmed by users through a resistor at pin FREQ. In auto CCM/DCM mode, the inductor current is continuous and the device operates in quasi-fixed switching frequency in medium and heavy load range, while the inductor current becomes discontinuous and the device automatically operates in PFM mode with an adaptive fixed on time and variable switching frequency in light load range.

Serial VID interface (SVID)

The NCP81109C supports Intel serial VID interface. It communicates with the microprocessor through three wires (SCLK, SDIO, ALERT#). SCLK, SDIO and ALERT# should be pulled high to CPU I/O voltage VTT (which is typically 1.0 to 1.1 V) using 55 Ω Resistors. The SVID bus will operate at a max frequency of 43 MHz. For NCP81109C, VID code change rate is controlled by the SVID interface with three options as shown in Table 6. All the supported registers are shown in Table 4.

Table 6. REGISTERS FOR VID CODE CHANGE RATE

Option	SVID Command Code	Feature	Register Address (Indicating the slew rate of VID code change)
SetVID_Fast	01h	selectable slew rate	24h
SetVID_Slow	02h	Fast_SR/2 Fast_SR/4: default Fast_SR/8 Fast_SR/16	25h
SetVID_Decay	03h	No control, VID code down	N/A

NCP81109C

Start Up Sequence

A timing diagram of start-up sequence is shown in Figure 5, and timing parameters are shown in Table 1.

Vboot pin to GND, which programs SVID address as well. Both values are set on power up and cannot be changed after the initial power up sequence is complete.

Boot Voltage and SVID Address

Table 7 shows two boot voltage options of 0.9 V and 1.35 V programmed by an external 1% resistor Rvboot from

Table 7. BOOT VOLTAGE AND SVID ADDRESS CONFIGURATION

Rvboot (Ω)	Vboot Pin Voltage (mV)			Address	Vboot (V)
	Min	Typ	Max		
0	0	0	102	0x0	0.9
14.0k	102	140	180	0x1	0.9
22.1k	180	219	258	0x2	0.9
30.1k	258	301	344	0x3	0.9
39.2k	344	391	438	0x4	0.9
48.7k	438	484	531	0x5	0.9

178k	1719	1789	1859	0x7	1.35
196k	1859	1950	-	0x8	1.35

Switching Frequency

Switching frequency is programmed by a resistor R_{FREQ} to ground at the FREQ pin. The typical frequency range is from 500 kHz to 1.2 MHz. The FREQ pin provides approximately 2 V out and the source current is mirrored into the internal ramp generator. The switching frequency can be found in Figure 7 with a given R_{FREQ}. The frequency

shown in Figure 7 is under condition of 10 A output current at VID = 1 V. The frequency has a variation over VID voltage and loading current, which maintains similar output ripple voltage over different operation condition. Figure 8 shows frequency variations over the VID voltage range.

NCP81109C

Figure 7. Switching Frequency vs. R_{FREQ}

Figure 8. Switching Frequency vs. VID Voltage

Remote Voltage Sense

A high performance differential amplifier is provided to accurately sense the output voltage of the regulator. The VSP and VSN inputs should be connected to the regulator's output voltage sense points. The output (DIFOUT) of the

remote sense amplifier is a sum of the error voltage (between the output VSP-VSN and the DAC) and a 1.3 V DC bias.

$$V_{DIFOUT} = (V_{VSP} - V_{VSN}) + (1.3 \text{ V} - V_{DAC}) \quad (\text{eq. 1})$$

The DIFOUT signal then goes through a compensation network and into the inverting input (FB pin) of an error amplifier. The non-inverting input of the error amplifier is

connected to the same 1.3 V used for the differential sense amplifier output bias.

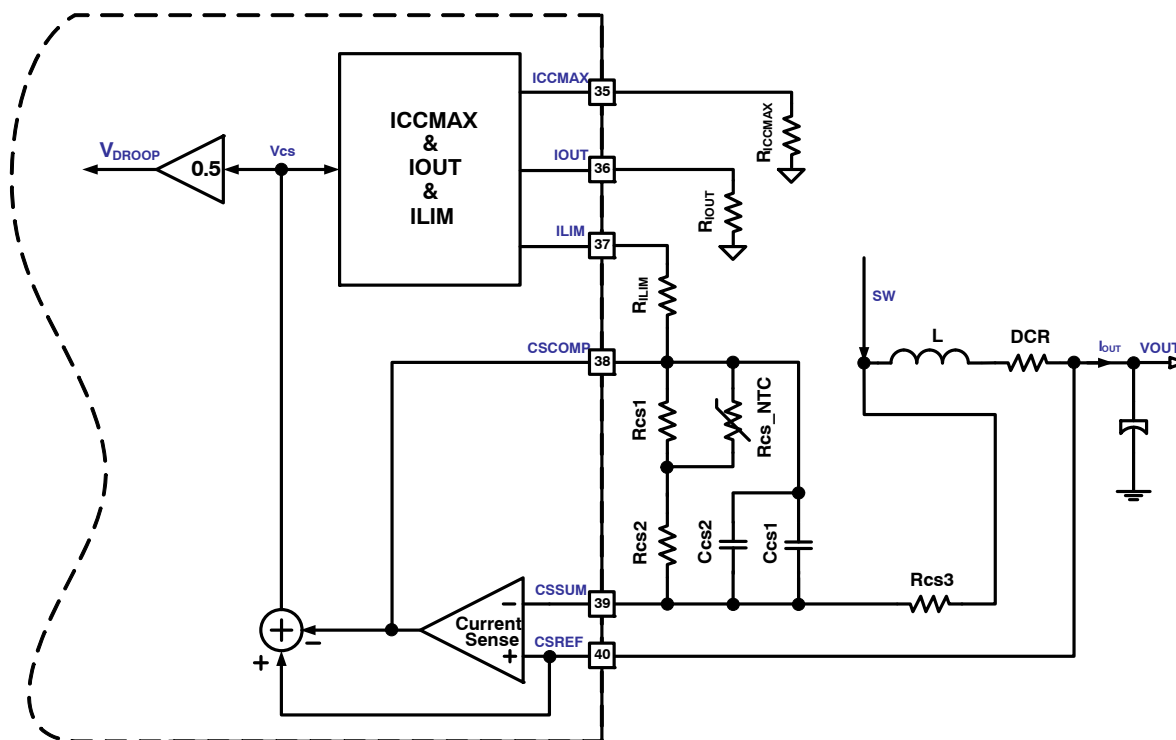

Figure 9. Differential Current-Sense Circuit Diagram

Differential Current Sense

The differential current-sense circuit diagram is shown in Figure 9. An internally-used voltage signal V_{CS} , representing the inductor current level, is the voltage difference between CSREF and CSCOMP. The output side of the inductor is used to create a low impedance virtual ground. The current-sense amplifier actively filters and gains up the voltage applied across the inductor to recover the voltage drop across the inductor's DC resistance (DCR). RCS_NTC is placed close to the inductor to sense the temperature. This allows the filter time constant and gain to be a function of the R_{th_NTC} resistor and compensate for the change in the DCR with temperature. The DC gain in the current sensing loop is

$$G_{CS} = \frac{V_{CS}}{V_{DCR}} = \frac{V_{CSREF} - V_{CSCOMP}}{I_{OUT} \cdot DCR} = \frac{R_{CS}}{R_{CS3}} \quad (\text{eq. 2})$$

Where

$$R_{CS} = R_{CS2} + \frac{R_{CS1} \cdot R_{CS_NTC}}{R_{CS1} + R_{CS_NTC}} \quad (\text{eq. 3})$$

The values of Rcs1 and Rcs2 are set based on a 220k NTC thermistor and the temperature effect of the inductor and thus usually they should not need to be changed. The gain

G_{CS} can be adjusted by the value change of the Rcs3 resistor to provide about 100 mV in V_{CS} at full load.

In order to recover the inductor DCR voltage drop current signal, the pole frequency in the CSCOMP filter should be set equal to the zero from the output inductor, that means

$$C_{CS1} + C_{CS2} = \frac{L}{DCR \cdot R_{CS}} \quad (\text{eq. 4})$$

Ccs1 and Ccs2 are in parallel to allow for a fine tuning of the time constant using commonly available values.

Over Current Protection

The NCP81109C provides two different types of current limit protection. Current limits are programmed with a resistor RILIM between the CSCOMP pin and the ILIM pin. The current from the ILIM pin to this resistor is then compared to two internal currents (10 μA and 15 μA) corresponding to two different current limit thresholds ILIM and ILIM_Fast (150% of ILIM level). If the ILIM pin current exceeds the 10 μA level, an internal latch-off timer starts. The controller shuts down if the fault is not removed after 50 μs . If the current into the pin exceeds 15 μA the controller will shut down immediately. To recover from an OCP fault the EN pin must be cycled low.

The value of RILIM can be designed using the following equation with a required over current protection threshold ILIM and a known current-sense network.

$$R_{ILIM} = \frac{V_{CS@I_{LIM}}}{10 \mu} = \frac{R_{CS}}{R_{CS3}} \cdot I_{LIM_PK} \cdot DCR \cdot 10^5$$

$$= \frac{R_{CS}}{R_{CS3}} \cdot \left(I_{LIM} + \frac{(V_{IN} - V_{OUT}) \cdot V_{OUT}}{2 \cdot L \cdot F_{SW} \cdot V_{IN}} \right) \cdot DCR \cdot 10^5 \quad (\text{eq. 5})$$

ICC_MAX

The SVID interface conveys the platform ICC_MAX value to the CPU by register 21h. A resistor R_ICC_MAX from the IMAX pin to ground programs this register at the time the part is enabled. A 10 μA current is sourced from this pin to generate a voltage on the program resistor. The value of the register is 1A per LSB and is set by the equation below. The resistor value should be no less than 10 k.

$$ICC_MAX_{21h} = \frac{R_{ICCMAX} \cdot 10 \mu \cdot 64}{2} = R_{ICCMAX} \cdot 3.2 \cdot 10^{-4} \quad (\text{eq. 6})$$

IOUT

The IOUT pin sources a current equal to the ILIM sink current gained by the IOUT Current Gain (10 typ.). The voltage of the IOUT pin is monitored by the internal A/D converter and should be scaled with an external resistor to ground such that a load equal to ICCMAX generates a 2 V signal on IOUT. A pull-up resistor to 5 V VCC can be used to offset the IOUT signal positive if needed.

$$R_{IOUT} = \frac{2}{10 \cdot V_{CS@ICC_MAX}} \cdot R_{ILIM}$$

$$= \frac{1}{5 \cdot \frac{R_{CS}}{R_{CS3}} \cdot ICC_MAX \cdot DCR} \cdot R_{ILIM} \quad (\text{eq. 7})$$

Input UVLO Protection

NCP81109C monitors supply voltages at the VCC pin and the VIN pins in order to provide under voltage protection. If either supply drops below its threshold, the controller will shut down the outputs. Upon recovery of the supplies, the controller reenters its startup sequence, and soft start begins.

Output Under-Voltage Protection

The output voltage is monitored by a dedicated differential amplifier. If the output falls below target by more than “Under Voltage Threshold below DAC–Droop”, the UVL comparator sends the VR_RDY signal low.

Output Over-Voltage Protection

During normal operation the output voltage is monitored at the differential inputs VSP and VSN. If the output voltage exceeds the DAC voltage by “Over Voltage Threshold above DAC”, GH will be forced low, and GL will go high. After the OVP trips, the DAC ramps slowly down to zero to avoid a negative output voltage spike during shutdown. If the DAC+OVP Threshold drops below the output, GL will again go high, and will toggle between low and high as the output voltage follows the DAC+OVP Threshold down. When the DAC gets to zero, the GH will be held low and the GL will remain high. To reset the part, the EN pin must be cycled low. During soft-start, the OVP threshold is set to 2.9 V. This allows the controller to start up without false triggering the OVP.

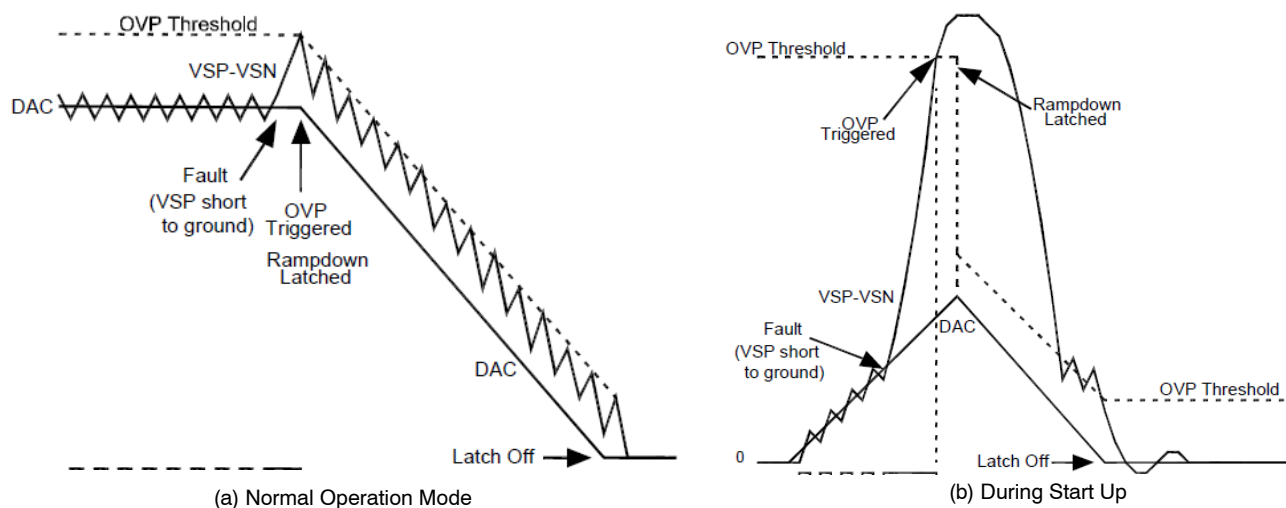

Figure 10. Function of Over Voltage Protection

Temperature Sense and Thermal Alert

The NCP81109C provides an external temperature sense and a thermal alert in normal operation mode. The temperature sense and thermal alert circuit diagram is shown in Figure 11. A precision current I_{TSENSE} is sourced out the output of the TSENSE pin to generate a voltage across the temperature sense network, which consists of a NTC thermistor R_{NTC} (100 k Ω typ.), two resistors R_{COMP1} (0 Ω typ.) and R_{COMP2} (8.2 k Ω typ.), and a filter capacitor C_{Filter} (0.1 μ F typ.). The voltage on the temperature sense input is sampled by the internal A/D converter and then digitally converted to temperature and stored in SVID register 17h. Usually the thermistor is placed close to a hot spot like inductor or NCP81109C itself. A 100k NTC thermistor similar to the Murata NCP15WF104D03RC should be used. The NCP81109C

also monitors the voltage at the TSENSE pin and compares the voltage to internal thresholds and assert ALERT# or VRHOT# once it trips the thresholds. The DC voltage at TSENSE pin can be calculated by

$$V_{TSENSE} = I_{TSENSE} \cdot \left(R_{COMP1} + \frac{R_{COMP2} \cdot R_{NTC_T}}{R_{COMP2} + R_{NTC_T}} \right) \tag{eq. 8}$$

R_{NTC_T} is the resistance of R_{NTC} at an absolute temperature T, which is obtained by

$$R_{NTC_T} = R_{NTC_T0} \cdot \exp\left(B \cdot \left(\frac{1}{T} - \frac{1}{T_0} \right) \right) \tag{eq. 9}$$

where R_{NTC_T0} is a known resistance of R_{NTC} at an absolute temperature T_0 , and B is the B-constant of R_{NTC} .

Figure 11. Temperature Sense and Thermal Alert Circuit Diagram

LAYOUT GUIDELINES

Electrical Layout Considerations

Good electrical layout is a key to make sure proper operation, high efficiency, and noise reduction. Electrical layout guidelines are:

- **Power Paths:** Use wide and short traces for power paths (such as VIN, VOUT, SW, and PGND) to reduce parasitic inductance and high-frequency loop area. It is also good for efficiency improvement.
- **Power Supply Decoupling:** The device should be well decoupled by input capacitors and input loop area should be as small as possible to reduce parasitic inductance, input voltage spike, and noise emission. Usually, a small low-ESL MLCC is placed very close to VIN and PGND pins.
- **VCC Decoupling:** Place decoupling caps as close as possible to the controller VCC and VCCP pins. The filter resistor at VCC pin should be not higher than 2.2 Ω to prevent large voltage drop.
- **Switching Node:** SW node should be a copper pour, but compact because it is also a noise source.
- **Bootstrap:** The bootstrap cap and an option resistor need to be very close and directly connected between pin 8 (BST) and pin 10 (SW). No need to externally connect pin 10 to SW node because it has been internally connected to other SW pins.
- **Ground:** It would be good to have separated ground planes for PGND and GND and connect the two planes at one point. Directly connect GND pin to the exposed pad and then connect to GND ground plane through vias.
- **Voltage Sense:** Use Kelvin sense pair and arrange a “quiet” path for the differential output voltage sense.
- **Current Sense:** Careful layout for current sensing is critical for jitter minimization, accurate current

limiting, and IOUT reporting. The filter cap from CSCOMP to CSREF should be close to the controller. The temperature compensating thermistor should be placed as close as possible to the inductor. The wiring path should be kept as short as possible and well away from the switch node.

- **Compensation Network:** The small feedback cap from COMP to FB should be as close to the controller as possible. Keep the FB traces short to minimize their capacitance to ground.
- **SVID Bus:** The Serial VID bus is a high speed data bus and the bus routing should be done to limit noise coupling from the switching node. The signals should be routed with the Alert# line in between the SVID clock and SVID data lines. The SVID lines must be ground referenced and each line’s width and spacing should be such that they have nominal 50 Ω impedance with the board stackup.

Thermal Layout Considerations

Good thermal layout helps high power dissipation from a small package with reduced temperature rise. Thermal layout guidelines are:

- The exposed pads must be well soldered on the board.
- A four or more layers PCB board with solid ground planes is preferred for better heat dissipation.
- More free vias are welcome to be around IC and underneath the exposed pads to connect the inner ground layers to reduce thermal impedance.
- Use large area copper pour to help thermal conduction and radiation.
- Do not put the inductor to be too close to the IC, thus the heat sources are distributed.
