

CAT8801

200 nA Microprocessor Power Supply Supervisors

Description

The CAT8801 is a supervisory circuit that monitors power supplies in digital systems and provides a reset signal whenever the system's input voltage is below a prescribed minimum level. The CAT8801 replaces popular voltage supervisors such as MAX809 in applications where operating current is a primary consideration.

CAT8801 generates a reset signal, which is asserted while the power supply voltage is below a preset threshold level and remains asserted for at least 140 ms after the power supply level has risen above that level. Nine industry standard threshold levels are offered to support +5.0 V, +3.3 V, +3.0 V, +2.5 V and +1.8 V systems. ON Semiconductor's floating gate technology, used in programming the trigger thresholds, makes it possible to quickly offer any custom reset threshold value should the 9 standard voltage thresholds not meet a system's needs.

The CAT8801 features a Push-Pull CMOS $\overline{\text{RESET}}$ output (active LOW) and is fully specified over the industrial temperature range of -40°C to 85°C .

CAT8801 is available in compact 3-pin SOT23 and SC-70 packages.

Features

- Precision Voltage Monitoring of +1.8 V, +2.5 V, +3.0 V, +3.3 V and +5.0 V Power Supplies
- Ultra Low 200 nA Supply Current
- $\pm 1.2\%$ Voltage Threshold Accuracy
- 270 ms Power-On Reset Timeout
- Reset Signal Valid Down to $V_{CC} = 1\text{ V}$
- No External Components Necessary
- High Immunity to Power-Supply Transients
- Industrial Temperature Range: -40°C to $+85^{\circ}\text{C}$
- Available in RoHS-compliant SOT-23 and SC-70 Packages

Applications

- Computers
- Servers
- Laptops
- Cable Modems
- Wireless Communications
- Embedded Control Systems
- Power Meters
- PDAs and Handheld Equipment

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 7 of this data sheet.

CAT8801

Table 1. PIN DESCRIPTION

Pin #	Name	Description
1	GND	Ground
2	RESET	Active LOW reset. RESET is asserted if V_{CC} falls below the reset threshold and remains low for at least 140 ms after V_{CC} rises above the reset threshold.
3	V_{CC}	Power supply voltage that is monitored.

Block Diagram

Table 2. ABSOLUTE MAXIMUM RATINGS

Parameters	Ratings	Units
Any pin with respect to ground	-0.3 to +6.0	V
Input Current, V_{CC}	20	mA
Output Current, RESET	20	mA
Rate of Rise, V_{CC}	100	V/ μ s
Continuous Power Dissipation		mW
Derate 2.2 mW/ $^{\circ}$ C above 70 $^{\circ}$ C (SC-70)	175	
Derate 4 mW/ $^{\circ}$ C above 70 $^{\circ}$ C (SOT-23)	320	
Operating Temperature Range	-40 to +85	$^{\circ}$ C
Storage Temperature Range	-65 to +150	$^{\circ}$ C
Lead Soldering Temperature (10 seconds)	300	$^{\circ}$ C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Figure 2. Supply Current vs. Temperature

Figure 3. Power-Down Reset Delay vs. Temperature

Figure 4. Normalized Reset Threshold vs. Temperature

Description

Reset Timing

The reset signal is asserted LOW for the CAT8801 when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 140 ms after the power supply voltage has risen above the threshold.

- All packages are RoHS-compliant (Lead-free, Halogen-free).
- The device used in the above example is a CAT8801LTB-GT3 (4.625 V, SOT-23, NiPdAu, Tape & Reel, 3,000/Reel).
- For availability of the various voltage, package and temperature options, please contact your nearest ON Semiconductor sales office.
- For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.
