## Features

- HIGH DENSITY PROGRAMMABLE LOGIC
- 4000 PLD Gates
- 48 I/O Pins, Two Dedicated Inputs
- 144 Registers
- High Speed Global Interconnect
- Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
- Small Logic Block Size for Random Logic
- NEW FEATURES
- 100\% IEEE 1149.1 Boundary Scan Testable
— ispJTAG ${ }^{\text {TM }}$ In-System Programmable via IEEE 1149.1 (JTAG) Test Access Port
- User Selectable 3.3V or 5V I/O Supports MixedVoltage Systems (Vccıo Pin)
- Open-Drain Output Option
- HIGH PERFORMANCE E²CMOS ${ }^{\circledR}$ TECHNOLOGY
- $\mathrm{fmax}=\mathbf{2 0 0} \mathrm{MHz}$ Maximum Operating Frequency
- tpd = 4.5 ns Propagation Delay
- TTL Compatible Inputs and Outputs
- Electrically Erasable and Reprogrammable
- Non-Volatile
- 100\% Tested at Time of Manufacture
- Unused Product Term Shutdown Saves Power
- IN-SYSTEM PROGRAMMABLE
- Increased Manufacturing Yields, Reduced Time-toMarket and Improved Product Quality
- Reprogram Soldered Devices for Faster Prototyping
- OFFERS THE EASE OF USE AND FAST SYSTEM

SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS

- Complete Programmable Device Can Combine Glue Logic and Structured Designs
- Enhanced Pin Locking Capability
- Four Dedicated Clock Input Pins
- Synchronous and Asynchronous Clocks
- Programmable Output Slew Rate Control to Minimize Switching Noise
- Flexible Pin Placement
- Optimized Global Routing Pool Provides Global Interconnectivity
- ispDesignEXPERT ${ }^{\text {TM }}$ - LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING
- Superior Quality of Results
- Tightly Integrated with Leading CAE Vendor Tools
- Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and ispANALYZER ${ }^{\text {TM }}$
- PC and UNIX Platforms

## Functional Block Diagram

## Description

The ispLSI 1024EA is a High Density Programmable Logic Device containing 144 Registers, 48 Universal I/O pins, two Dedicated Input pins, four Dedicated Clock Input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 1024EA features 5 V in-system diagnostic capabilities via IEEE 1149.1 Test Access Port. The ispLSI 1024EA device offers non-volatile reprogrammability of the logic, as well as the interconnects to provide truly reconfigurable systems. A functional superset of the ispLSI 1024 architecture, the ispLSI 1024EA device adds user selectable 3.3 V or 5 V I/O and open-drain output options.

The basic unit of logic on the ispLSI 1024EA device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1...D7 (Figure 1). There are a total of 24 GLBs in the ispLSI 1024EA device. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any other GLB on the device.

[^0]
## Functional Block Diagram

Figure 1. ispLSI 1024EA Functional Block Diagram

The device also has 48 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, registered input, latched input, output or bi-directional I/O pin with 3 -state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA . Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. By connecting the VCCIO pin to a common 5 V or 3.3 V power supply, I/O output levels can be matched to 5 V or 3.3 V -compatible voltages.

Eight GLBs, 16 I/O cells, dedicated inputs (if available) and one ORP are connected together to make a Megablock (Figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. Each ispLSI 1024EA device contains three Megablocks.

The GRP has, as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 1024EA device are selected using the Clock Distribution Network. Four dedicated clock pins (Y0, Y1, Y2 and Y3) are brought into the distribution network, and five clock outputs (CLK 0, CLK 1, CLK 2, IOCLK 0 and IOCLK 1) are provided to route clocks to the GLBs and I/O cells. The Clock Distribution Network can also be driven from a special clock GLB (CO on the ispLSI 1024EA device). The logic of this GLB allows the user to create an internal clock from a combination of internal signals within the device.

## Programmable Open-Drain Outputs

In addition to the standard output configuration, the outputs of the ispLSI 1024EA are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified Voh and Vol levels, whereas the open-drain output drives only the specified Vol. The Voh level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. The default configuration when the device is in bulk erased state is totem-pole configuration. The open-drain/totem-pole option is selectable through the ispDesignEXPERT software tools.

## Boundary Scan

Figure 2. Boundary Scan Waveforms and Timing Specifications

## DC Electrical Characteristics

Over Recommended Operating Conditions

| SYMBOL | PARAMETER | CONDITION | MIN. | TYP. ${ }^{3}$ | MAX. | UNITS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| VOL | Output Low Voltage | $\mathrm{I}_{\mathrm{OL}}=8 \mathrm{~mA}$ | - | - | 0.4 | V |
| VOH | Output High Voltage | $\mathrm{I}_{\mathrm{OH}}=-2 \mathrm{~mA}, \mathrm{~V}_{\mathrm{CCIO}}=3.0 \mathrm{~V}$ | 2.4 | - | - | V |
|  |  | $\mathrm{I}_{\mathrm{OH}}=-4 \mathrm{~mA}, \mathrm{~V}_{\mathrm{CCIO}}=4.75 \mathrm{~V}$ | 2.4 | - | - | V |
| IIL | Input or I/O Low Leakage Current | $0 \mathrm{~V} \leq \mathrm{V}_{\text {IN }} \leq \mathrm{V}_{\text {IL }}$ (Max.) | - | - | -10 | $\mu \mathrm{A}$ |
| IIH | Input or I/O High Leakage Current | $\left(\mathrm{V}_{\text {CCIO }}-0.2\right) \mathrm{V} \leq \mathrm{V}_{\text {IN }} \leq \mathrm{V}_{\text {CCIO }}$ | - | - | 10 | $\mu \mathrm{A}$ |
|  |  | $\mathrm{V}_{\text {CCIO }} \leq \mathrm{V}_{\text {IN }} \leq 5.25 \mathrm{~V}$ | - | - | 10 | $\mu \mathrm{A}$ |
| IIL-PU | I/O Active Pull-Up Current | $\mathrm{OV} \leq \mathrm{V}_{\text {IN }} \leq \mathrm{V}_{\text {IL }}$ | - | - | -200 | $\mu \mathrm{A}$ |
| IOS ${ }^{1}$ | Output Short Circuit Current | $\mathrm{V}_{\text {CCIO }}=5.0 \mathrm{~V}$ or $3.3 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=0.5 \mathrm{~V}$ | - | - | -240 | mA |
| ICC ${ }^{2,4,5}$ | Operating Power Supply Current | $\begin{aligned} & \mathrm{V}_{\mathrm{IL}}=0.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{IH}}=3.0 \mathrm{~V} \\ & \mathrm{f}_{\text {TOGGLE }}=1 \mathrm{MHz} \end{aligned}$ | - | 152 | - | mA |

1. One output at a time for a maximum duration of one second. $\mathrm{V}_{\text {OUT }}=0.5 \mathrm{~V}$ was selected to avoid test problems by tester ground degradation. Characterized but not $100 \%$ tested.
2. Measured using eight 16 -bit counters.
3. Typical values are at $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}$ and $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.
4. Unused inputs held at 0.0 V .
5. Maximum I Icc varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and the Thermal Management section of the Lattice Semiconductor Data Book CD-ROM to estimate maximum Icc.

$=(\boldsymbol{t g y} 0(\max )+\boldsymbol{\operatorname { t g }} \mathbf{c}+\boldsymbol{\operatorname { t g c p }}(\max ))+(\boldsymbol{t g h})-(\mathbf{t i o b p}+\boldsymbol{t g r p} 4+\mathbf{t} 20 \mathrm{ptxor})$
$=(\# 55+\# 42+\# 57)+(\# 41)-(\# 22+\# 30+\# 37)$
$1.4=(0.9+1.4+1.8)+(1.0)-(0.3+1.5+1.9)$
tco $=$ Clock (max) + Reg (clock-to-out) + Output
$=(\mathbf{t g y} 0(\max )+\mathbf{t g c o}+\mathbf{t g c p}(\max ))+(\mathbf{t g c o})+(\mathbf{t o r p}+\mathbf{t o b})$
$=(\# 55+\# 42+\# 57)+(\# 42)+(\# 48+\# 50)$
$7.2=(0.9+1.4+1.8)+(1.4)+(0.8+0.9)$

1. Calculations are based upon timing specifications for the ispLSI 1024EA-200.

## Maximum GRP Delay vs GLB Loads

## Power Consumption

Power consumption in the ispLSI 1024EA device de- used. Figure 4 shows the relationship between power pends on two primary factors: the speed at which the and operating speed. device is operating, and the number of product terms

Figure 4. Typical Device Power Consumption vs fmax

Notes: Configuration of eight 16-bit counters
Typical current at $5 \mathrm{~V}, 25^{\circ} \mathrm{C}$
Icc can be estimated for the ispLSI 1024EA using the following equation:
Icc $=17 \mathrm{~mA}+(\#$ of PTs *.726 $)+(\#$ of nets * Max Freq *.0043 $)$
Where:
\# of PTs = Number of Product Terms used in design
\# of nets = Number of Signals used in device
Max freq = Highest Clock Frequency to the device (in MHz)
The Icc estimate is based on typical conditions (Vcc $=5.0 \mathrm{~V}$, room temperature) and an assumption of four GLB loads on average exists. These values are for estimates only. Since the value of Icc is sensitive to operating conditions and the program in the device, the actual Icc should be verified.

## Pin Description

| NAME | TQFP PIN NUMBERS | DESCRIPTION |
| :---: | :---: | :---: |
| I/O 0 - I/O 3 <br> I/O 4 - I/O 7 <br> I/O 8 - I/O 11 <br> I/O 12 - I/O 15 <br> I/O 16 - I/O 19 <br> I/O 20 - I/O 23 <br> I/O 24 - I/O 27 <br> I/O 28 - I/O 31 <br> I/O 32 - I/O 35 <br> I/O 36 - I/O 39 <br> I/O 40 - I/O 43 <br> I/O 44 - I/O 47 | 19, 20, 21, 22, <br> 23, 28, 29, 30, <br> 31, 32, 33, 34, <br> 42, 43, 44, 45, <br> 46, 47, 48, 53, <br> 54, 55, 56, 57, <br> 69, 70, 71, 72, <br> 73, 78, 79, 80, <br> 81, 82, 83, 84, <br> 92, 93, 94, 95, <br> 96, 97, 98, 3, <br> 4, 5, 6, 7 | Input/Output Pins - These are the general purpose I/O pins used by the logic array. |
| $\begin{aligned} & \text { GOE 0/IN } 4^{1} \\ & \text { GOE } 1 / I N 5^{1} \end{aligned}$ | 91 8 | This is a dual function pin. It can be used either as Global Output Enable for all I/O cells or it can be used as a dedicated input pin. <br> This is a dual function pin. It can be used either as Global Output Enable for all I/O cells or it can be used as a dedicated input pin. |
| TDI <br> TMS <br> TDO <br> TCK | $18$ <br> 68 <br> 35 <br> 58 | Input - Functions as an input pin to load programming data into the device and also used as one of the two control pins for the ispJTAG state machine. <br> Input - Controls the operation of the ISP state machine. <br> Output - Functions as an output pin to read serial shift register data. <br> Input - Functions as a clock pin for the Serial Shift Register. |
| $\overline{\text { RESET }}$ <br> YO <br> Y1 <br> Y2 <br> Y3 | 17 9 67 60 59 | Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device. <br> Dedicated Clock input. This clock input is connected to one of the clock inputs of all of the GLBs on the device. <br> Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB on the device. <br> Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB and/or any I/O cell on the device. <br> Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any I/O cell on the device. |
| GND VCC | $\begin{array}{llll} 14, & 15, & 36, & 37, \\ 61, & 62, & 89, & 90 \\ 10, & 11, & 40, & 41, \\ 65, & 66, & 85, & 86 \end{array}$ | Ground (GND) <br> Vcc |
| VCCIO | 16 | Supply voltage for output drivers, 5 V or 3.3 V . |
| $N C^{2}$ | 1, 2, 12, 13, <br> 24, 25, 26, 27, <br> 38, 39, 49, 50, <br> 51, 52, 63, 64, <br> 74, 75, 76, 77, <br> 87, 88, 99, 100 | No Connect |

1. Pins have dual function capability which is software selectable.

Table 2-0002A/1024EA
2. NC pins are not to be connected to any active signals, Vcc or GND.

## Pin Configurations

ispLSI 1024EA 100-Pin TQFP Pinout Diagram

1. Pins have dual function capability which is software selectable.
2. NC pins are not to be connected to any active signal, VCC or GND.

## Specifications ispLSI 1024EA

## Part Number Description

## ispLSI 1024EA Ordering Information

## COMMERCIAL

| FAMILY | $\mathbf{f m a x}(\mathrm{MHz})$ | tpd $(\mathrm{ns})$ | ORDERING NUMBER | PACKAGE |
| :---: | :---: | :---: | :---: | :---: |
| ispLSI | 200 | 4.5 | ispLSI 1024EA-200LT100 | 100-Pin TQFP |
|  | 125 | 7.5 | ispLSI 1024EA-125LT100 | 100-Pin TQFP |
|  | 100 | 10 | ispLSI 1024EA-100LT100 | 100-Pin TQFP |
