SX1501/SX1502/SX1503

4/8/16 Channel Low Voltage GPIO with NINT and NRESET

GENERAL DESCRIPTION

The SX1501, SX1502 and SX1503 are complete ultra low voltage General Purpose parallel Input/Output (GPIO) expanders ideal for low power handheld battery powered equipment. They allow easy serial expansion of I/O through a standard I²C interface. GPIO devices can provide additional control and monitoring when the microcontroller or chipset has insufficient I/O ports, or in systems where serial communication and control from a remote location is advantageous.

These devices can also act as a level shifter to connect a microcontroller running at one voltage level to a component running at a different voltage level. The core is operating as low as 1.2V while the I/O banks can operate between 1.2V and 5.5V independent of the core voltage and each other.

Each GPIO is programmable via 8-bit configuration registers. Data registers, direction registers, pull-up/pull-down registers, interrupt mask registers and interrupt registers allow the system master to program and configure 4 or 8 or 16-GPIOs using a standard 400kHz I²C interface.

The SX1501, SX1502 and SX1503 offer a unique fully programmable logic functions like a PLD to give more flexibility and reduce external logic gates used for standard applications.

The SX1501, SX1502 and SX1503 have the ability to generate mask-programmable interrupts based on falling/rising edge of any of its GPIO lines. A dedicated pin indicates to a host controller that a state change occurred in one or more of the GPIO lines.

The SX1501, SX1502 and SX1503 each come in a small QFN-UT-20/28 package. All devices are rated from -40°C to +85°C temperature range.

KEY PRODUCT FEATURES

- 4/8/16 channel of I/Os
 - True bi-directional style I/O
 - Programmable Pull-up/Pull-down
 - Push/Pull outputs
- 1.2V to 5.5V independent operating voltage for all supply rails (VDDM, VCC1, VCC2)
- 5.5V compatible I/Os, up to 24mA output sink (no total sink current limit)
- Fully programmable logic functions (PLD)
- 400kHz 2-wire I²C compatible slave interface
- Open drain active low interrupt output (NINT)
 - Bit maskable
 - Programmable edge sensitivity
- Power-On Reset and reset input (NRESET)
- Ultra low current consumption of typ. 1uA
- -40°C to +85°C operating temperature range
- Ultra-Thin 3x3mm QFN-UT-20 package (SX1501/SX1502)
- Ultra-Thin 4x4mm QFN-UT-28 package (SX1503)

TYPICAL APPLICATIONS

- Cell phones, PDAs, MP3 players
- Digital camera
- Portable multimedia player
- Notebooks
- GPS Units
- Industrial, ATE
- Any battery powered equipment

2 ELECTRICAL CHARACTERISTICS
2.1 Absolute Maximum Ratings

Stress above the limits listed in the following table may cause permanent failure. Exposure to absolute ratings for extended time periods may affect device reliability. The limiting values are in accordance with the Absolute Maximum Rating System (IEC 134). All voltages are referenced to ground (GND).

Symbol	Description	Min	Max	Unit
VDDM _{max}	Main supply voltage	- 0.4	6.0	V
VCC1,2 _{max}	I/O banks supply voltage	- 0.4	6.0	V
V _{ESD HBM}	Electrostatic handling HBM model ⁽¹⁾	-	1500	V
V _{ESD CDM}	Electrostatic handling CDM model	-	300	V
V _{ESD MM}	Electrostatic handling MM model	-	200	V

V_{nH}	Noise margin at the HIGH level for each connected device (including hysteresis)	-	$0.2*V_{DDM}$	-	-	V
Miscellaneous						
RPULL	Programmable pull-up/down resistors for IO[0-7]	-	-	60	-	k Ω
t_{PLD}	PLD propagation delay	$V_{CC1,2} \& V_{DDM} = 5V$	-	-	25	ns
		$V_{CC1,2} \& V_{DDM} = 1.2V$	-	-	500	

(1) Assuming no load connected to outputs and inputs fixed to VCC1,2 or GND.

(2) Can be increased in RegAdvanced register. Please refer to §2.2.1 for more details.

(3) All values referred to $V_{IHMR\ min}$ and $V_{ILM\ max}$ levels.

(4) A device must internally provide a hold time of at least 300ns for the SDA signal (referred to $V_{IHMR\ min}$) to bridge the undefined region of the falling edge of SCL.

(5) The maximum $t_{HD;DAT}$ has only to be met if the device does not stretch the LOW period (t_{LOW}) of the SCL signal.

(6) A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal.

If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{r\ max} + t_{SU;DAT} = 1000 + 250 = 1250$ ns (according to the Standard-mode I²C-bus specification) before the SCL line is released.

(7) C_b = total capacitance of one bus line in pF. If mixed with Hs-mode devices, faster fall-times are allowed.

4.4 Reset (NRESET)

The SX1501, SX1502 and SX1503 generate their own power on reset signal after a power supply is connected to the VDDM pin. The reset signal is made available for the user at the pin NRESET. The rising edge of the NRESET indicates that the startup sequence of the SX1501, SX1502 or SX1503 has finished. NRESET must be connected to VDDM (or greater) either directly, or via a resistor.

Figure 7 – Power-On / Brown-out Reset Conditions

1. Device behavior is undefined until VDDM rises above VPOR, at which point NRESET is driven to GND by the SX1501, SX1502 or SX1503.
2. After t_{RESET} , NRESET is released (high-impedance) by the SX1501, SX1502 or SX1503 to allow it to be pulled high by an external resistor.
3. In operation, the SX1501, SX1502 and SX1503 may be reset at anytime by an external device driving NRESET low during t_{PULSE} . Chip can be accessed normally again after NRESET rising edge.

WIRELESS & SENSING

4. During a brown-out event, if VDDM drops above VDROPH a reset will not occur.
5. During a brown-out event, if VDDM drops between VDROPH and VDROPL a reset may occur.
6. During a brown-out event, if VDDM drops below VDROPL a reset will occur next time VPOR is crossed.

Please note that a brown-out event is defined as a transient event on VDDM. If VDDM is attached to a battery, then the gradual decay of the battery voltage will not be interpreted as a brown-out event.

Please also note that a sharp rise in VDDM ($> 1V/us$) may induce a circuit reset.

4.5 2-Wire Interface (I²C)

The SX1501, SX1502 and SX1503 2-wire interface (I²C compliant) operates only in slave mode. In this configuration, the device has one or two device addresses defined by ADDR pin.

Device	ADDR Pin	I ² C Address	Description
SX1501 & SX1502	0	0x20 (0100000)	First address of the 2-wire interface
	1	0x21 (0100001)	Second address of the 2-wire interface
SX1503		0x20 (0100000)	Fixed address of the 2-wire interface

Table 7 - 2-Wire Interface Address

2 lines are used to exchange data between an external master host and the slave device:

- **SCL** : Serial CLock
- **SDA** : Serial DAta

The SX1501, SX1502 and SX1503 are read-write slave-mode I²C devices and comply with the Philips I²C standard Version 2.1 dated January, 2000. The SX1501, SX1502 and SX1503 have respectively 12, 16, and 31 user-accessible internal 8-bit registers. The I²C interface has been designed for program flexibility, in that once the slave address has been sent to the SX1501, SX1502 or SX1503 enabling it to be a slave transmitter/receiver, any register can be written or read independently of each other. While there is no auto increment/decrement capability in the SX1501 and SX1502 I²C logic, a tight software loop can be designed to access the next register independent of which register you begin accessing. SX1503 implements auto increment capability. The start and stop commands frame the data-packet and the repeat start condition is allowed if necessary.

Seven bit addressing is used and ten bit addressing is not allowed. Any general call address will be ignored by the SX1501, SX1502 and SX1503. The SX1501, SX1502 and SX1503 are not CBUS compatible and can operate in standard mode (100kbit/s) or fast mode (400kbit/s).

4.5.1 WRITE

The simplest format for an I²C write is given below. After the start condition [S], the slave address is sent, followed by an eighth bit indicating a write. The I²C then acknowledges that it is being addressed, and the master responds with an 8 bit data byte consisting of the register address. The slave acknowledges and the master sends the appropriate 8 bit data byte. Once again the slave acknowledges and the master terminates the transfer with the stop condition [P].

WIRELESS & SENSING

Figure 9 – Write RegData Register

Please note that SX1503 implements register address auto-increment i.e. after the Data ACK from Slave the master can write further bytes and the interface will handle the register address increment automatically. Finally the master terminates the transfer normally the stop condition [P].

4.5.2 READ

After the start condition [S], the slave address is sent, followed by an eighth bit indicating a write. The I²C then acknowledges that it is being addressed, and the master responds with an 8 bit data byte consisting of the register address. The slave acknowledges and the master sends the repeated start condition [Sr]. Once again, the slave address is sent, followed by an eighth bit indicating a read. The slave responds with an acknowledge and the previously addressed 8 bit data byte; the master then sends a non-acknowledge (NACK). Finally, the master terminates the transfer with the stop condition [P].

Register Address: 8 bit

Figure 10 - 2-Wire Serial Interface, Read Register Operation

Please note that SX1503 implements register address auto-increment i.e. after the Data byte from Slave the master can acknowledge (ACK) to indicate that it wants to read the next byte and the interface will handle the register address increment automatically. Finally the master terminates the transfer normally with a NACK followed by the stop condition [P].

4.5.3 READ - STOP separated format (SX1501 and SX1502 only)

When operating SX1501 or SX1502, stop-separated reads can also be used. This format allows a master to set up the register address pointer for a read and return to that slave at a later time to read the data. In this format the slave address followed by a write command are sent after a start [S] condition. The slave then acknowledges it is being addressed, and the master responds with the 8-bit register address. The master sends a Stop or Restart condition and may then address another slave. After performing other tasks, the master can send a start or restart condition to the slave with a read command. The slave acknowledges this request and returns the data from the register location that had previously been set up.

4.6 Interrupt (NINT)

At start-up, the transition detection logic is reset, and NINT is released to a high-impedance state. The interrupt mask register is set to 0xFF, disabling the interrupt output for transitions on all I/O ports. The transition flags are cleared to indicate no data changes.

An interrupt NINT can be generated on any programmed combination of I/Os rising and/or falling edges through the RegInterruptMask and RegSense registers. If needed, the I/Os which triggered the interrupt can then be identified by reading RegInterruptSource register.

When NINT is low (i.e. interrupt occurred), it can be reset back high (i.e. cleared) by writing 0xFF in RegInterruptSource (this will also clear corresponding bits in RegEventStatus register). SX1503 also allows the interrupt to be cleared automatically when reading RegData register (Cf. RegAdvanced)

Example: We want to detect rising edge of I/O[1] on SX1502 (NINT will go low).

1. We enable interrupt on I/O[1] in RegInterruptMask
 ⇒ RegInterruptMask = "XXXXXX0X"

2. We set edge sense for I/O[1] in RegSense
 ⇒ RegSenseLow = "XXXX01XX"

4.7 Programmable Logic Functions (PLD)

The SX1501, SX1502 and SX1503 offer a unique fully programmable logic functions like a PLD to give more flexibility and reduce external logic gates used for standard applications. Since the whole truth table is fully programmable, the SX1501, SX1502, and SX1503 can implement combinatory functions ranging from the basic AND/OR gates to the most complicated ones with up to four 3-to-1 PLDs or two 3-to-2 PLDs which can also be externally cascaded if needed.

In all cases, any IO not configured for PLD functionality retains its GPIO functionality while I/Os used by the PLD have their direction automatically set accordingly.

Please note that while RegDir corresponding bits are ignored for PLD operation they may still be set to input to access unused PLD inputs as normal GPI (PLD truth table can define some inputs to have no effect on PLD output) and/or generate interrupt based on any of the PLD inputs or outputs bits.

4.7.1 SX1501

The SX1501 I/Os can be configured to provide any combinational 2-to-1 logic function using I/O[0-2] whilst retaining GPIO capability on I/O[3] OR provide a combinational 3-to-1 decode function using all 4 I/O ports.

4.7.4 Tutorial

The generic method described in this paragraph can be applied to any of the SX1501, SX1502 or SX1503.

Example: We want to implement an AND gate between I/O[0] and IO[1] on SX1502

1. Identify in the tables above the RegPLDMode setting to be programmed.
What we need corresponds to the second line of the SX1502 PLD Table => RegPLDMode = "xx00xx01"
2. Fill corresponding RegPLDTableX with the wanted truth table.
As mentioned in RegPLDMode description, using PLD 2-to-1 mode on I/O[0-2] implies to fill the truth table located in RegPLDTable0(3:0)

I/O[1]	I/O[0]	I/O[2]
0	0	0
0	1	0
1	0	0
1	1	1

=> RegPLDTable0 = "xxx1000"

WIRELESS & SENSING

6 APPLICATION INFORMATION

6.1 Typical Application Circuit

Figure 12 - Typical Application Schematic

6.2 Typical LED Operation

Typical LED operation is described below. The LED is usually connected to a high voltage (VBAT) to take advantage of the high sink current of the I/O and to accommodate high LED threshold voltages (VLED).

^{*}LED colour/technology dependent

Figure 13 – Typical LED Operation

Important:

- ❖ VCCx must exceed VBAT-VLED (VCCx = VBAT is recommended) else the LED will never be completely OFF
- ❖ R must be calculated for IOL not to exceed its max spec (Cf. Table 5)

6.2.1 LED ON/OFF Control

	RegDir[x]	RegData[x]
LED ON	"0" (Output)	"0"
LED OFF		"1"

Table 18 – LED ON/OFF Control

WIRELESS & SENSING

6.2.2 LED Intensity Control

When the max IOL spec is not enough it is possible to drive simultaneously multiple I/Os connected together hence increasing the total sink capability.

Example: on an SX1502, by driving an LED with both IO[2] and IO[3] one can sink up to $24+24=48\text{mA}$.

Driving an LED with multiple I/Os can also be used to implement more intensity steps for the LED.

Example: with two I/Os capable of sinking each 24mA the LED can sink a total of 0mA (no I/O set to "0"), 24mA (one I/O set to "0") or 48mA (both I/Os set to "0") => 3 LED intensity steps (4 steps with 3 I/Os, 5 steps with 4 I/Os, etc)

6.3 Keypad Implementation

SX1501, SX1502, and SX1503 can be used to implement keypad applications up to 8×8 matrix (i.e. 64 keys)

Example: We want to implement a 4×4 matrix keypad on SX1502

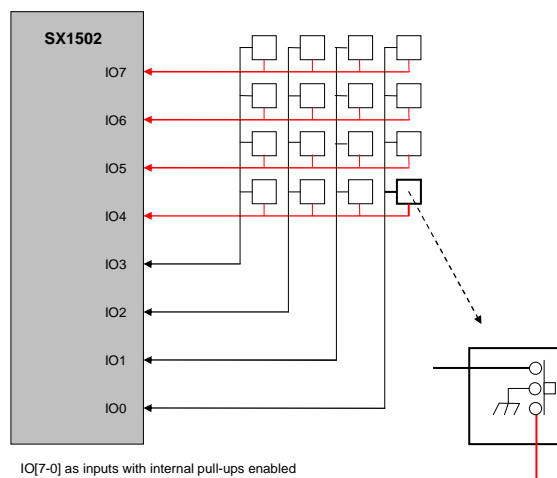

Figure 14 – 4×4 keypad connection to SX1502

1. Set all I/Os as inputs with internal pull-up ($\text{RegDir} = 0\text{xFF}$, $\text{RegPullUp} = 0\text{xFF}$)
2. Set NINT to be triggered on any IO's falling edge ($\text{RegInterruptMask} = 0\text{x00}$, $\text{RegSenseHigh} = 0\text{xAA}$, $\text{RegSenseLow} = 0\text{xAA}$)
3. When NINT goes low read RegData (or $\text{RegInterruptSource}$) to know the X:Y coordinates of the button which has been pressed.
4. Clear NINT ($\text{RegInterruptSource} = 0\text{xFF}$, can be done automatically on SX1503 depending on RegAdvanced setting)
5. Restart from point 3

6.4 Level Shifter Implementation Hints

Because of their I/O banks with independent supply voltages between 1.2V and 5.5V , the SX1502 and SX1503 can be easily used to perform level shifting of signals from one I/O bank to another (uC reads I/O from one I/O bank and sends it back to the other I/O bank)

This can save significant BOM cost in a final application where only a few slow signals need to be level-shifted.

7.1 QFN-UT 20-pin Outline Drawing

QFN-UT 20-pin, 3 x 3 mm, 0.4 mm pitch

NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.
3. DAP IS 1.90 x 1.90mm.

NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. THIS LAND PATTERN IS FOR REFERENCE PURPOSES ONLY. CONSULT YOUR MANUFACTURING GROUP TO ENSURE YOUR COMPANY'S MANUFACTURING GUIDELINES ARE MET.
3. THERMAL VIAS IN THE LAND PATTERN OF THE EXPOSED PAD SHALL BE CONNECTED TO A SYSTEM GROUND PLANE. FAILURE TO DO SO MAY COMPROMISE THE THERMAL AND/OR FUNCTIONAL PERFORMANCE OF THE DEVICE.

7.3 QFN-UT 28-pin Outline Drawing

QFN-UT 28-pin, 4 x 4 mm, 0.4 mm pitch

NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

7.4 QFN-UT 28-pin Land Pattern

NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. THIS LAND PATTERN IS FOR REFERENCE PURPOSES ONLY. CONSULT YOUR MANUFACTURING GROUP TO ENSURE YOUR COMPANY'S MANUFACTURING GUIDELINES ARE MET.
3. THERMAL VIAS IN THE LAND PATTERN OF THE EXPOSED PAD SHALL BE CONNECTED TO A SYSTEM GROUND PLANE. FAILURE TO DO SO MAY COMPROMISE THE THERMAL AND/OR FUNCTIONAL PERFORMANCE OF THE DEVICE.
4. SQUARE PACKAGE-DIMENSIONS APPLY IN BOTH X AND Y DIRECTIONS.

8 SOLDERING PROFILE

The soldering reflow profile for the SX1501, SX1502 and SX1503 is described in the standard IPC/JEDEC J-STD-020C. For detailed information please go to <http://www.jedec.org/download/search/jstd020c.pdf>

Profile Feature	Sn-Pb Eutectic Assembly	Pb-Free Assembly
Average Ramp-Up Rate ($T_{s_{max}}$ to T_p)	3 °C/second max.	3° C/second max.
Preheat		
- Temperature Min ($T_{s_{min}}$)	100 °C	150 °C
- Temperature Max ($T_{s_{max}}$)	150 °C	200 °C
- Time ($t_{s_{min}}$ to $t_{s_{max}}$)	60-120 seconds	60-180 seconds
Time maintained above:		
- Temperature (T_L)	183 °C	217 °C
- Time (t_L)	60-150 seconds	60-150 seconds
Peak/Classification Temperature (T_p)	See Table 4.1	See Table 4.2
Time within 5 °C of actual Peak Temperature (t_p)	10-30 seconds	20-40 seconds
Ramp-Down Rate	6 °C/second max.	6 °C/second max.
Time 25 °C to Peak Temperature	6 minutes max.	8 minutes max.

Note 1: All temperatures refer to topside of the package, measured on the package body surface.
