

DS90LV001 800 Mbps LVDS Buffer

Check for Samples: [DS90LV001](#)

FEATURES

- Single +3.3 V Supply
- LVDS Receiver Inputs Accept LVPECL Signals
- TRI-STATE Outputs
- Receiver Input Threshold $< \pm 100$ mV
- Fast Propagation Delay of 1.4 ns (Typ)
- Low Jitter 800 Mbps Fully Differential Data Path
- 100 ps (Typ) of pk-pk Jitter with PRBS = $2^{23}-1$ Data Pattern at 800 Mbps
- Compatible with ANSI/TIA/EIA-644-A LVDS Standard
- 8 pin SOIC and Space Saving (70%) WSON Package
- Industrial Temperature Range

DESCRIPTION

The DS90LV001 LVDS-LVDS Buffer takes an LVDS input signal and provides an LVDS output signal. In many large systems, signals are distributed across backplanes, and one of the limiting factors for system speed is the "stub length" or the distance between the transmission line and the unterminated receivers on individual cards. Although it is generally recognized that this distance should be as short as possible to maximize system performance, real-world packaging concerns often make it difficult to make the stubs as short as the designer would like.

The DS90LV001, available in the WSON package, will allow the receiver to be placed very close to the main transmission line, thus improving system performance.

A wide input dynamic range will allow the DS90LV001 to receive differential signals from LVPECL as well as LVDS sources. This will allow the device to also fill the role of an LVPECL-LVDS translator.

An output enable pin is provided, which allows the user to place the LVDS output in TRI-STATE.

The DS90LV001 is offered in two package options, an 8 pin WSON and SOIC.

I _{CCZ}	TRI-STATE Supply Current	EN = 0V		22	35	mA	

- (1) Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except V_{OD} and ΔV_{OD}.
- (2) All typical are given for V_{CC} = +3.3V and T_A = +25°C, unless otherwise stated.
- (3) Output short circuit current (I_{OS}) is specified as magnitude only, minus sign indicates direction only.

t_{RJ}	LVDS Clock Jitter, Random ⁽⁶⁾	$V_{ID} = 300mV; V_{CM} = 1.2V$ at 400MHz clock		2.2	3.5	ps

- (1) All typical are given for $V_{CC} = +3.3V$ and $T_A = +25^\circ C$, unless otherwise stated.
- (2) The parameters are ensured by design. The limits are based on statistical analysis of the device performance over the PVT (process, voltage and temperature) range.
- (3) t_{SKD1} , $|t_{PLHD} - t_{PHLD}|$, is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.
- (4) t_{SKD3} , Part to Part Skew, is defined as the difference between the minimum and maximum specified differential propagation delays. This specification applies to devices at the same V_{CC} and within $5^\circ C$ of each other within the operating temperature range.
- (5) t_{SKD4} , Part to Part Skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices over recommended operating temperature and voltage ranges, and across process distribution. t_{SKD4} is defined as $|Max - Min|$ differential propagation delay.
- (6) The parameters are ensured by design. The limits are based on statistical analysis of the device performance over the PVT range with the following test equipment setup: HP8133A (pattern pulse generator), 5 feet of RG142B cable with DUT test board and HP83480A (digital scope mainframe) with HP83484A (50GHz scope module). The HP8133A with RG142B cable exhibit a $t_{DJ} = 21ps$ and $t_{RJ} = 1.8ps$.

DS90LV001 Pin Descriptions (SOIC and WSON)

Pin Name	Pin #	Input/Output	Description
GND	1	P	Ground
IN -	2	I	Inverting receiver LVDS input pin
IN+	3	I	Non-inverting receiver LVDS input pin
NC	4		No Connect
V _{CC}	5	P	Power Supply, 3.3V ± 0.3V.
OUT+	6	O	Non-inverting driver LVDS output pin
OUT -	7	O	Inverting driver LVDS output pin
EN	8	I	Enable pin. When EN is LOW, the driver is disabled and the LVDS outputs are in TRI-STATE. When EN is HIGH, the driver is enabled. LVC MOS/LVTTL levels.
DAP	NA	NA	Die Attach Pad or DAP (WSON Package only). The DAP is NOT connected to the device GND nor any other pin. It is still recommended to connect the DAP to a GND plane of a PCB for enhanced heat dissipation.

TYPICAL APPLICATIONS

Backplane Stub-Hider Application

Cable Repeater Application

APPLICATION INFORMATION

MODE OF OPERATION

The DS90LV001 can be used as a "stub-hider." In many systems, signals are distributed across backplanes, and one of the limiting factors for system speed is the "stub length" or the distance between the transmission line and the unterminated receivers on the individual cards. Although it is generally recognized that this distance should be as short as possible to maximize system performance, real-world packaging concerns and PCB designs often make it difficult to make the stubs as short as the designer would like. The DS90LV001, available in the WSON package, can improve system performance by allowing the receiver to be placed very close to the main transmission line either on the backplane itself or very close to the connector on the card. Longer traces to the LVDS receiver may be placed after the DS90LV001. This very small WSON package is a 75% space savings over the SOIC package.

INPUT FAILSAFE

The receiver inputs of the DS90LV001 do not have internal failsafe biasing. For point-to-point and multidrop applications with a single source, failsafe biasing may not be required. When the driver is off, the link is in-active. If failsafe biasing is required, this can be accomplished with external high value resistors. Using the equations in the LVDS Owner's Manual Chapter 4, the IN+ should be pull to V_{CC} (3.3V) with 20k Ω and the IN- should be pull to GND with 12k Ω . This provides a slight positive differential bias, and sets a known HIGH state on the link with a minimum amount of distortion.

PCB LAYOUT AND POWER SYSTEM BYPASS

Circuit board layout and stack-up for the DS90LV001 should be designed to provide noise-free power to the device. Good layout practice also will separate high frequency or high level inputs and outputs to minimize unwanted stray noise pickup, feedback and interference. Power system performance may be greatly improved by using thin dielectrics (4 to 10 mils) for power/ground sandwiches. This increases the intrinsic capacitance of the PCB power system which improves power supply filtering, especially at high frequencies, and makes the value and placement of external bypass capacitors less critical. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range 0.01 μF to 0.1 μF . Tantalum capacitors may be in the range 2.2 μF to 10 μF . Voltage rating for tantalum capacitors should be at least 5X the power supply voltage being used. It is recommended practice to use two vias at each power pin of the DS90LV001 as well as all RF bypass capacitor terminals. Dual vias reduce the interconnect inductance by up to half, thereby reducing interconnect inductance and extending the effective frequency range of the bypass components.

The outer layers of the PCB may be flooded with additional ground plane. These planes will improve shielding and isolation as well as increase the intrinsic capacitance of the power supply plane system. Naturally, to be effective, these planes must be tied to the ground supply plane at frequent intervals with vias. Frequent via placement also improves signal integrity on signal transmission lines by providing short paths for image currents which reduces signal distortion. The planes should be pulled back from all transmission lines and component mounting pads a distance equal to the width of the widest transmission line or the thickness of the dielectric separating the transmission line from the internal power or ground plane(s) whichever is greater. Doing so minimizes effects on transmission line impedances and reduces unwanted parasitic capacitances at component mounting pads.

There are more common practices which should be followed when designing PCBs for LVDS signaling. Please see application note [AN-1108](#) for guidelines. In addition, application note [AN-1187](#) has additional information specifically related to WSON recommendations.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
